X4 investigates how the public views the corporation and its worth. It is beneficial to compile all available market data. The corporation evaluates its value using market data, such as debt and equity ratios. Based on market data, X4 also calculates how much the company's assets must degrade in value until the force outweighs the assets and the business goes bankrupt.

Another crucial ratio that assesses management's capacity to work hard is X5. In this instance, the corporation generates corporate income using the capital turnover ratio as a financial indicator.

Refer to the calculations in Table 9, X1 variable showing decline, especially during 2018-2021. Positive working capital indicates a firm's ability to pay its debts, whereas negative working capital implies a company may find it difficult to satisfy its existing obligations, which increases the likelihood that the company will face major financial difficulties.

It appears that variable X2 remained relatively stable, while X3 have a tendency to fluctuate. In particular, during the period of 2020 and 2021, X3 showed a sharp drop in compared to the other years. These drops in values are caused by the company's declining profitability, which is demonstrated by the value of EBIT that experiencing a sharp decline. Meanwhile, X4 variables showed relatively stable; this indicates that the company is capable of meeting the long-term value of its capital requirements (common shares). According to Altman, the lower

this ratio indicates, the smaller the firm's ability to satisfy obligations coming from its own capital, increasing the likelihood that the company may have financial difficulties (Adi et al., 2015). The result showed a decrease in the X5 variable especially in 2020, which is specific to the Z score calculation for private companies, indicating that the company can generate income using the resources it has. This is influenced by the COVID-19 pandemic, which disrupts the company's operations in finishing projects done to generate income.

Table 10 shows the Final Computation with all variables (X1, X2, X3, X4, and X5) calculated into the formula.

Based on the Z-Score calculation shown in Table 10 for PT Jasa Marga Tbk during the period 2018-2020, it can be said that the company's performance has decreased and led to a state of distress. Financial distress can occur from various factors, one of which is internal as well as external factors of the company (Peter & Yoseph, 2011). This decline was primarily caused by a decline in profitability as evidenced by the achievement of turnover and profit, as shown by the decline in EBIT achievement, as well as a decrease in Net Working Capital in line with an increase in working capital loans for carrying out projects undertaken, particularly strategic projects. The obligation of JSMR to participate in important toll road projects as investors also has an effect on growing the company's assets, but from a return perspective, it still takes time to see rewards. The COVID-19 pandemic, which has affected Indonesia since early 2020 and disrupted business in many sectors, including the construction industry, is making this condition worse because it has delayed construction and driven up costs as a result of enforcing stringent health protocols.

Based on the results of the calculation of the Altman Z-score formula during the research period, the Z value tends to decrease showing Financial Distress to PT Jasa Marga across all periods 2018-2022, where surprisingly the impact of COVID-19 doesn't actually alter too differently from other years. This shows that the company is in serious financial trouble and ultimately the company has the potential to go bankrupt.

CONCLUSION

The financial performance of PT Jasa Marga Tbk in the infrastructure construction sector has shown signs of distress, and the Covid-19 pandemic that struck in early 2020 made matters worse by delaying project completion and increasing costs as a result of enforcing stringent health protocols. However the composition of the Altman Z-score during the pandemic (in 2020-2021) and before the pandemic (in 2019–2018) and after (in 2022) shows that JSMR's experiencing Financial Distress during all periods.

According to calculations of the ratios of Net Working Capital to Total Assets, Retained Earnings to Total Assets, Earnings Before Interest and Taxes to Total Assets, and Market Value/Book Value of Equity to Total Liabilities, JSMR had a declining financial performance. Financially speaking, the company saw an increase in corporate liabilities as a result of working on government projects, an increase in profit as a result of investing in long-term strategic projects, and a decline in financial performance in terms of revenue and profit (EBIT), particularly as a result of the COVID-19 pandemic, which had an effect on the company's operations.

Based on the results of the 2018-2022 Z-score, PT Jasa Marga Tbk experienced a decline in financial performance which led to financial distress and the potential for bankruptcy. There are several way-outs that can be done as a solution to this financial distress. According to Ross, Westerfield, and Jaffe's (2010) financial distress literature review, reducing capital spending and research and development, issuing new securities, and negotiating with banks and other creditors.

RECOMMENDATION

The results of this study can be utilized as guidance and feedback for the management who runs the business and innovates during challenging periods, like the Covid-19 pandemic or financial upheaval. This analysis strengthens the case that in a pandemic emergency, the government will prioritize spending for the COVID-19 pandemic recovery, which is anticipated to hasten the pace of recovery for commercial and industrial activity. Construction sector SOEs like PT Jasa Marga must develop a strategy to **strengthen their core construction business and financial capabilities** in an uncertain time **by rebalancing their project portfolios and reorganizing their finances to solve mismatch financing**. PT Jasa Marga as the leading SOE in the infrastructure construction sector needs **support from the Government** of Indonesia to ensure continual of strategic infrastructure projects hence **relaxation of capital, loans, and cash flows** are required to ensure project completion can be carried out.

This study offers useful insights for academics, professionals, and management on how to assess financial health and what course of action to take in the event that a company encounters financial challenges.

ABSTRACT

The Covid-19 pandemic caused half of the world's population to be placed on lockdown to stop the spread of Covid-19. The Indonesian government also issued the lockdown policy, called PSBB and PPKM. Tyre manufacturing as one of important part in automotive industries faced difficult situation in the periods. The growth of the industry can develop when the mobility of society and business continues to increase normally. However, due to the issuance of the government policy, caused the mobility of people and business activities has drastically reduced, which also means that the use of tires would also decrease. This study intended to analyze the financial health of PT Gajah Tunggal, Tbk (Gjtl), one of the biggest tyre manufacturings in Indonesia by using Altman Z-score bankruptcy approach in periods of 2019 – 2022, and showing the impact of the Covid-19 pandemic. The result can be used by the management group of the company to take any action and/or business decision in order to keep its financial performance based on shareholder's expectation and come up with strategy in facing economic turbulence. This study further contributes by providing a comprehensive overview of financial health analysis and review the ratios contribute to corporate bankruptcy.

Keywords: Financial Health, Bankruptcy, Altman Z-Score, Tyre

INTRODUCTION

The impact of the Covid-19 pandemic has been experienced by almost all sectors of the economy and is being felt throughout the world including Indonesia. Various policies issued by the government to reduce the rate of transmission on a large scale. a number of industries stopped production, transportation both land, sea and air were limited. Likewise, human movement is very limited both between countries, between provinces and even between districts and cities. In addition, the financial market and capital market also experienced a significant impact and under pressure due to significant volatility. Direct impact of this situation can be seen from the decreasing of purchase power of society, losing job, and increase in poverty level.

During the year of 2020, depreciaton of Indonesia currency Rupiah was happened, and the Indonesia Composite Index fell by 5.09%. Tambunan (2020) shows that automotive and/or tyre industry is not preferred segment to invest in during the pandemic period, but the other sector like; consumer industry, the telecommunications, pharmaceuticals and public health segment like hospitals, are become the sectors that investors choose to invest. Pusdatin Kemenperin (2021) informed the contractions growth of transportation equipment industry have been experienced since the first quarter of 2019, so for the whole year of 2019 the industry is contracting growth of 3.43%. After experiencing growth positive by 4.64% (yoy) on first quarter of 2020, in second quarter 2020 Transportation Equipment Industry experiencing intense contractions means, that is equal to 34.29% (yoy), which is a contraction the biggest among all industry groups within the sector non-oil industry. Contraction on The transportation equipment industry continues lasts until the fourth quarter 2020, but slowed down to of 18.98% (yoy) of contraction by 29.98% (yoy) in the quarter III 2020.

Figure-1: Automotive industry growth (%)

Source: (Pusdatin Kemenperin 2021)

Among 15 industrial sectors non-oil processing in Indonesia, the automotive industry is the most affected sector during the Covid-19 pandemic, with deepest contraction in years 2020 reached 19.86% (yoy).

This condition is quite concerning, because the automotive industry which is expected to be the backbone of growth of the non-oil and gas industry, will likely require extra hard efforts to be able to bounce back to the its condition before the pandemic.

Table-1: Number of Motor Vehicles by Type, 2017-2021 (units)

Source: Land Transportation Statistics, BPS Statistics Indonesia, Catalog 8302004, 2021

As part of automotive industry, tyre manufacturing is directly connected to its growth. Export News Indonesia, Ministry of Trade 2016, forecasting the Indonesia tyre market is to increase at a CAGR of more than 13% until 2020.

The financial health of a company is an important indicator and some method have been developed to analyzed it. Altman (1968) has introduced Altman Z-score to assess a company's financial health by considering several indicators such as; Retained Earnings, Working Capital, EBIT, Sales and Market Value of Equity. It is used as a guide in identifying the bankruptcy of a company with Altman Z-score approach to analyse financial health, which have been conducted before including those by Silitonga and Daryanto (2020); Daryanto et al. (2020); Sugeng (2021). This study is focused on one object of research which is the tyre manufacturing industry before and after the Covid-19 pandemic storm.

Therefore, this study is intended to supplement previous studies by analyzing the financial health of tyre industry before and during the Covid-19 pandemic. Net sales of PT Gajah Tunggal Tbk's declined in Q1 2020 compared to Q1 2019 as the impact of the Covid-19 pandemic started to affect the Company's sales performance. Net sales declined by 6.0%, to Rp 3,797 billion in 1Q20. Sales in both the domestic and export market declined by 5.2% and 7.3% respectively.

LITERATURE REVIEW

Tyre Industry in Indonesia

In Indonesia, automotive and its components industry is considered as important segment due to its big employment and involving several industries to support the business operation. The

contribution to the national economy id quite significant contribution on the national economy.
Equipment Industry

Transport accounts for approx. 1.35% of the national GDP in 2020, or contribute around 7.57% of industrial GDP non-oil processing (Pusdatin Kemenperin, 2021). For tyre, the domestic industry continues to grow in line with the rapid development of production of four-wheeled and two-wheeled vehicles in Indonesia.

PT Gajah Tunggal Tbk (Gjtl)

PT Gajah Tunggal Tbk (Gjtl) was established on 1951, started the business of manufacturing of bicycle tires. The Company is located in Tangerang, Indonesia have a vision “To be a Good Corporate Citizen with Solid Financial Standing, Market Leadership in Indonesia and an established Global Reputation as a Manufacturer of Quality Tires”. The business was expanded to produce motorcycle tires in 1971 and continued to produce bias tires for passenger and commercial vehicles with technical assistance from the Yokohama Rubber Company of Japan. The company was listed on the Jakarta and Surabaya Stock Exchange by 1990 and 3 years after that The Company started commercial production of radial tires for passenger cars and light trucks. Now PT Gajah Tunggal Tbk (Gjtl) is one of the largest integrated tire manufacturer in Southeast Asia region, produces and distribute tires for passenger car, SUV's, commercial, off-the-road, industrial and motorcycles.

Financial Statements

The definition of financial statements in Financial Accounting Standards, according to the Institute of Indonesia Chartered Accountants/IAI (2015), is a structured presentation of an entity's financial position and financial performance. There are three common components of a financial statements; income statement, balance sheet, and cash flow statement. In this study, the report used in this study is the financial statement contained in the annual report of PT Gajah Tunggal Tbk (Gjtl) from 2019 and 2022.

Bankruptcy: Altman's Model Approach

In this study, the Altman Z-score model is used to determine the company's financial health, identifying forecast of possibility of a firm experiencing bankruptcy. Bankruptcy is a condition when the company unable to fulfilled obligations or debt due to insufficient fund to run the business (Brigham and Ehrhardt, 2005). This model created by Edward Altman in 1968 and the input value to the formula is from balance sheet and income statement.

$$Z = 1.2X1 + 1.4X2 + 3.3X3 + 0.6X4 + 1.0X5$$

Where;

Z = Altman's Z Score

X1 = Working Capital/Total Assets

X2 = Retained Earnings/Total Assets

X3 = Earnings Before Interest and Taxes/Total Assets

X4 = Market Value of Total Equity/Book Value of Total Liabilities

X5 = Sales/Total Assets

The result of the formula, Z value will be used to categorized the Company's financial health. According to Altman, there are three categories, namely:

1. Safe zone if Z value > 2.6; companies that are not bankrupt
2. Gray zone if Z value is $1.1 < Z < 2.6$; (it cannot be determined whether the company is healthy or bankrupt)
3. Distress zone if the Z value < 1.1; a bankrupt company.

RESEARCH METHOD

This study is analyzing the financial report of PT Gajah Tunggal Tbk (Gjtl) which is published to public over the period of the first quarter of 2019 and the fourth quarter of 2022. All the data are tabulated in order to see the score and the zone for each quarter.

Research Concept Framework

The concept framework used in this research is based on previous research theory and study results. This research is intended to examine the financial health of PT Gajah Tunggal Tbk (Gjtl). The financial statements are collected and and analysed base on the Altman Z-Score model bankruptcy indicator to determine healthiness of the company's financial. Figure 4 explain the step by steap of the research and finally conclude based on the formula.

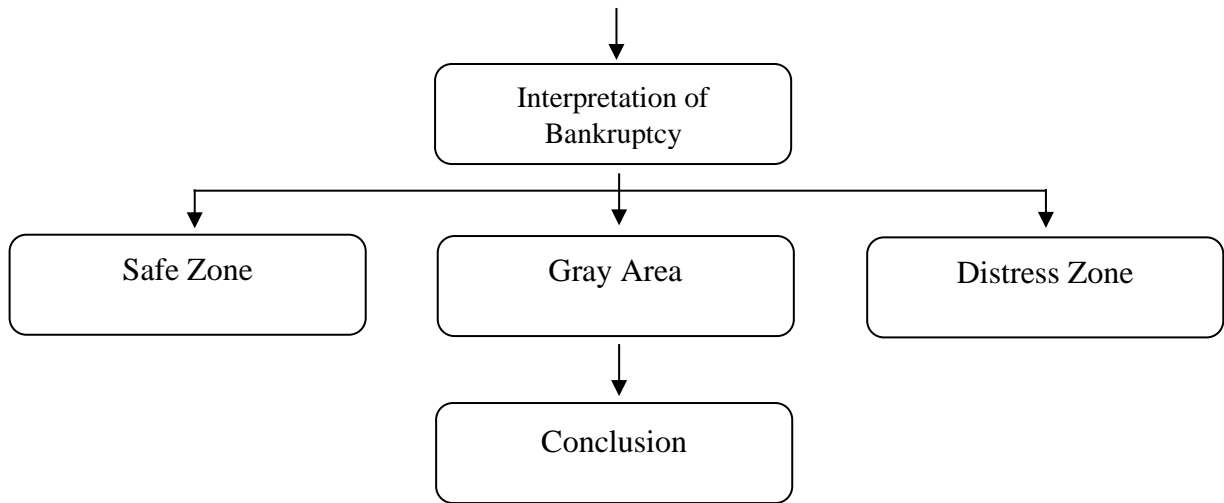

Figure2: Research Concept Framework (Authors, 2023)

Definition Variable Operational

Working Capital to Total Asset (X1)

This ratio is derived by dividing the working capital by total assets. The result will shows the ability of a company to generate working capital from its total assets. It is derived by. The formula is:

$$X1 = \frac{\textit{Working Capital}}{\textit{Total Assets}}$$

Retained Earnings to Total Assets (X2)

This ratio derived by dividing the retained earnings to total assests and will shows ability of the the company to generate retained earnings from its total assets. The formula for X₂ is:

$$X2 = \frac{\textit{Retained Earnings}}{\textit{Total Assets}}$$

Earnings Before Interest and Tax (EBIT) to Total Assets (X3)

This ratio derived by dividing EBIT to total assets and the result will shows the ability of thr Company to generate profits from the its assets deducted by tax and interests expenses. The formula is:

$$X3 = \frac{\textit{EBIT}}{\textit{Total Assets}}$$

Market Value of Equity to Total Liabilities (X4)

This ratio is used to measure the company’s ability to meet its obligations and obligations from the market value of its capital (common stock). The formula is:

$$X4 = \frac{\text{Market Value of Equity}}{\text{Book Value of Debt}}$$

Sales to Total Assets (X5)

This ratio is used to measure number of sales that can be generated by the total assets. The formula is:

$$X5 = \frac{\text{Sales}}{\text{Total Assests}}$$

RESULT AND DISCUSSION

RESULT

Table 4 show several data to be used to calculate all the Variable Operational (X1, X2, X3, X4 and X5) as mentioned above. It shows Working Capital, Total Assets, Retained Earning, EBIT (Earnings Before Interest and Tax), Market Value of Equity, and Total Liabilities, and Sales for period of 2019 untill 2022 in million rupiah. The working capital is fluctuate but become higher from first quarter 2021. During first quarter 2021 untill third quarter 2021, market value of equity is lower than others period where first quarter 2021 as the lowest point. At that peiod for the first time in the range of 2019-2022, EBIT value is minus.

Table-4: Data Source for the Variable Operational 2019-2022 in million rupiah

DISCUSSION

1. Ratio X1 (Net Working Capital / Total Assets)

Table 6 below shows the Net Working Capital of PT Gajah Tunggal in period of 2019-2022 shows that the number all positives in the range of 0.13 – 0.21. As this ratio is used to measure the Company's ability in fulfilling short-term liabilities and it also measure the level of liquidity of assets, the positive value shows the company's ability to pay its bills.

Table-6: Net Working Capital to Total Assets

Period	Q1-19	Q2-19	Q3-19	Q4-19	Q1-20	Q2-20	Q3-20	Q4-20	Q1-21	Q2-21	Q3-21	Q4-21	Q1-22	Q2-22	Q3-22	Q4-22
X1	0.14	0.14	0.13	0.14	0.14	0.14	0.15	0.16	0.20	0.21	0.19	0.20	0.20	0.18	0.18	0.19

Source: (Author Analysis; 2023)

2. Ratio X2 (Accumulated Retained Earnings / Total Assets)

According to Altman based on previous research by (Adi et al, 2015), companies that have high retained earnings also show that the company can finance its assets through its profits so the company does not use huge debt.

Table-7: Accumulated Retained Earnings to Total Assets

Period	Q1-19	Q2-19	Q3-19	Q4-19	Q1-20	Q2-20	Q3-20	Q4-20	Q1-21	Q2-21	Q3-21	Q4-21	Q1-22	Q2-22	Q3-22	Q4-22
X2	0.22	0.22	0.22	0.24	0.20	0.24	0.24	0.27	0.27	0.26	0.25	0.26	0.26	0.25	0.24	0.26

Source: (Author Analysis; 2023)

According to Table 5, in the period of 2019-2022 shows that the accumulated retained earnings of PT Gajah Tunggal, Tbk is showing positive which means the Company has been able to generate a profit, and to grow to finance the company's operational activities.

3. Ratio X3 (Earnings Before Interest and Taxes EBIT / Total Assets)

To measure the ability or productivity of assets in generating profits the ratio of Earnings Before Interest and Tax to Total Assets is used. The higher the value of this ratio, shows effectiveness of the management of all assets is increase.

Table-8: Earnings Before Interest and Taxes / Total Assets

Period	Q1-19	Q2-19	Q3-19	Q4-19	Q1-20	Q2-20	Q3-20	Q4-20	Q1-21	Q2-21	Q3-21	Q4-21	Q1-22	Q2-22	Q3-22	Q4-22
X3	0.02	0.03	0.04	0.07	0.01	0.01	0.03	0.07	0.02	0.03	0.03	0.05	0.01	0.01	0.02	0.04

Source: (Author Analysis; 2023)

Table-8, show the result of Ratio X3 in the period of 2019-2022. Most of the number is positive, except in first quarter 2020 which is negative. It is an indication that in this period there is a financial distress. Based on financial report, this quarter is the lowest sales value booked by the Company.

4. Ratio X4 (Market Value of Equity / Total Liabilities)

The research by (Adi et al., 2015) according to Altman, the Company's ability to meet long-term obligations that comes from own capital indicated by this ratio. The lower the ratio the higher possibility of the company in experiencing financial distress.

Table-9: Market Value of Equity to Total Liabilities

Period	Q1-19	Q2-19	Q3-19	Q4-19	Q1-20	Q2-20	Q3-20	Q4-20	Q1-21	Q2-21	Q3-21	Q4-21	Q1-22	Q2-22	Q3-22	Q4-22
X4	0.17	0.19	0.17	0.16	0.07	0.11	0.13	0.21	0.27	0.23	0.20	0.20	0.18	0.19	0.17	0.17

Source: (Author Analysis; 2023)

According to Table-9, the result of Ratio X4 was decreased since the third quarter of 2019 and the lowest one was in the first quarter of 2020. In the next quarter of 2020, the ratio is increasing

and back to range before that period. Based on this data, it can be concluded that Waskita was able to meet long-term debts/liabilities owned in total company equity.

5. Ratio X5 (Sales / Total Assets)

This ratio is used to measures how efficient is a company in utilizing its assets to generate revenue. The higher the ration indicates that a company effectively uses its assets to generate revenue. Table-10 below shows lowest ratio is in first quarter 2020, and the highest ratio is in last quarter 2022. In each year, the highest ratio always happen in forth quarter and first quarter always the lowest in each year. It means total sales in first quarter is lower compared with the rest quarter.

Table-10: Sales to Total Assets

Period	Q1-19	Q2-19	Q3-19	Q4-19	Q1-20	Q2-20	Q3-20	Q4-20	Q1-21	Q2-21	Q3-21	Q4-21	Q1-22	Q2-22	Q3-22	Q4-22
X5	0.20	0.40	0.62	0.85	0.19	0.32	0.53	0.76	0.21	0.38	0.58	0.83	0.22	0.43	0.65	0.90

Source: (Author Analysis; 2023)

CONCLUSION

The Company was in the distress condition from beginning of 2019 but Covid-19 pandemic that started in early 2020 had give an impact on the performance of PT Gajah Tunggal, Tbk and make it worse. The biggest impact can be can be seen from the total sales in first quarter 2020 which is only 23.8% from previous quarter and about 95% year on year. Based on results ratio calculation, the financial performance of PT Gajah Tunggal in terms of Earning Before Interest and Taxes to Total Assets, and Market Value of Equity to Total Liabilities and Sales to Total Assets showing significant decrease from first quater 2020 due to very low sales where the company was contributed loss in profits and lead to unable to pay its company obligations, and based on Z-score it has possibility to illiquid and insolvent.

Based on the Z-score result, in period of 2019-2022, PT Gajah Tunggal, Tbk experienced financial distress and potential for bankruptcy for 8 quarters and in the grey area for the rests of quarter. The Company never been in safe zone during the period covered in this research. To step out from the distress situation several action can be taken. According to the financial distress literature review Ross, Westerfield, and Jaffe (2010), reducing capital spending and research and development, issuing new securities, and negotiating with banks and other creditors.

The findings of this study can be used as input and consideration for managers managing companies and innovating during economic turbulence, such as the Covid-19 pandemic. PT Gajah Tunggal must set the strategy to bring the financial condition to safe zone through improving sales performance and financial restructuring.

ABSTRACT

The Russia-Ukraine war has led to disruptions in global supply chains and increasing majority of commodity price including coal. These coal price increases come on top of already tight commodity markets due to a solid demand recovery from the pandemic, as well as numerous pandemic-related supply constraints. PT. United Tractors Tbk is a subsidiary of PT. Astra International Tbk that focuses on heavy equipment, mining and energy. For the last ten years, more than 50% of the revenue has been generated from the mining industry, especially coal mining that automatically get benefits from this conflict. This study examines the impact of the Russia-Ukraine war on the financial performance of PT. United Tractors Tbk using a combination of quantitative analysis comparison before and during the war, years 2021-2022. The study analyzes financial data from UNTR's annual reports and financial statements, as well as from secondary data, such as industry reports and news articles. The study will review and compare the financial performance between 2021 and 2022 represented by using four key ratios, such as Liquidity Ratio, Profitability Ratio, Activity Ratio, Solvency Ratio. The comparison reveals that PT. United Tractors Tbk has been impacted by the Russia-Ukraine on positive way, it can be considered as a wind fall both for the company and investor.

Keywords: Liquidity Ratio, Profitability Ratio, Activity Ratio, Solvency Ratio, Russia-Ukraine War

1. INTRODUCTION

Russia-Ukraine war sparks surge in coal price to unprecedented levels, the conflict between Russia and Ukraine has sent thermal coal prices skyrocketing to new heights, as some European countries look to ban Russian coal. Six month after the invasion, On September 2022 thermal coal price is reach all time high at \$ 457/mt for 6300 kcal/kg GAR FOB Australia Newcastle Port. Indonesia coal price also reach its all time record, representing on Indonesia Coal Index (ICI) the FOB Kalimantan 4,200 kcal/kg GAR touched a year-to-date high March 10 2022 at \$136/mt, the day after FOB Kalimantan 5,000 kcal/kg GAR hit its year-to-date high at \$190/mt March 9 2022. Even though both prices then eased, they have averaged a firm \$86.50/mt and \$128.65/mt, respectively, to date in 2022 (see Figure 1). The Russia-Ukraine war shot Asian thermal coal prices to record levels in 2022 as additional demand from Europe, which sanctioned Russian fuel, created supply tightness. Even though prices have receded in recent months, they remain at levels higher than the average of the last two years.

Coal markets have been shaken severely in 2022, with traditional trade flows disrupted, prices soaring and demand set to grow by 1.2%, reaching an all-time high and surpassing 8 billion tonnes for the first time. Despite the global energy crisis, our overall outlook remains unchanged, as various factors are offsetting each other. Russia’s invasion of Ukraine has sharply altered the dynamics of coal trade, price levels, and supply and demand patterns in 2022. In 2022, high natural gas prices led to significant fuel switching to coal in electricity generation in Europe, although both gas and coal generation increased as the growth of wind and solar was insufficient to fully offset lower hydro and nuclear power output. In China, low hydropower output in the summer amid a big heat wave pushed coal power generation significantly higher. In August, coal power generation in China increased by around 15% year-on-year to over 500 terawatt-hours (TWh). This monthly level of generation is higher than the total annual coal power generation of any other country, except India and the United States. In India and China, where coal is the backbone of electricity systems and gas accounts for just a fraction of power generation, the impact of steeper gas prices on coal demand has been limited. Nevertheless, increased coal use in these countries has replaced some gas, which has been purchased by other regions willing to pay more for it. Coal power generation rise to a new record in 2022, surpassing its 2021 levels. This is driven by robust coal power growth in India and the European Union (EU) and by small increases in China – and it comes despite a decline in the United States.

Figure-2: Indonesia Coal Price Trend 6300 GAR

The Indonesia Coal Export

In recent years, Indonesia has faced several challenges in the coal sector, including changes in coal demand, environmental concerns, and the global transition towards cleaner energy sources. These factors have impacted the country's coal exports and are likely to shape the industry's future. In 2022 Indonesia produced 687 million tonnes of coal and exported 465 million tonnes, production in 2022 was higher than the target of 663 million tonnes despite an export ban at the start of the year that caused some miners to hold back output, as well as heavy rains that disrupted operations. According to shipping data from consultancy Kpler, Indonesia’s exports to India, South Korea, Taiwan and the Philippines, all rose in 2022, while shipments to its biggest market, China, dipped in 2022. The export trend show in Table 1, and the trend of seaborne thermal supply and demand show in Table 2.

The Company is a subsidiary of PT Astra International Tbk (“Astra”), a well-established and one of the largest business groups in Indonesia with robust experience of serving various industries and sectors. Since September 19, 1989, the Company has become a public company by listing its shares on the Indonesia Stock Exchange (formerly the Jakarta Stock Exchange and Surabaya Stock Exchange). To date Astra owns 59.5% of the Company’s shares, with the remaining shares are held by the public.

Currently, the Company is a key player in various sectors and industries in the country through its five business pillars, namely Construction Machinery, Mining Contracting, Mining, Construction Industry and Energy.

Business Segments:

Construction Machinery: PT United Tractors is the authorized distributor of various renowned heavy equipment brands, including Komatsu, Scania, Bomag, and UD Trucks, in Indonesia. The company offers sales, rental, after-sales services, spare parts, and maintenance for these brands.

Mining Contractor: Through its subsidiary, PT Pamapersada Nusantara (PAMA) dan PT Kalimantan Prima Persada (KPP) provides mining contracting services to support the mining industry in Indonesia. Its services encompass mine planning, overburden removal, coal mining, and reclamation. The company's expertise and fleet of heavy equipment make it a significant player in the mining sector.

Coal Mining: Through its subsidiary, PT Buah Turangga Agung (Turangga Resources) PT United Tractors is involved in coal mining operations. This subsidiary engages in coal exploration, production, and marketing, contributing to the energy sector in Indonesia. Currently most of the coal asset located in central Kalimantan.

Gold Mining : The gold mining business is run by PT Agincourt Resources (PTAR), of which United Tractors has a 95% stake. PTAR operates the Martabe gold mine, located in the South

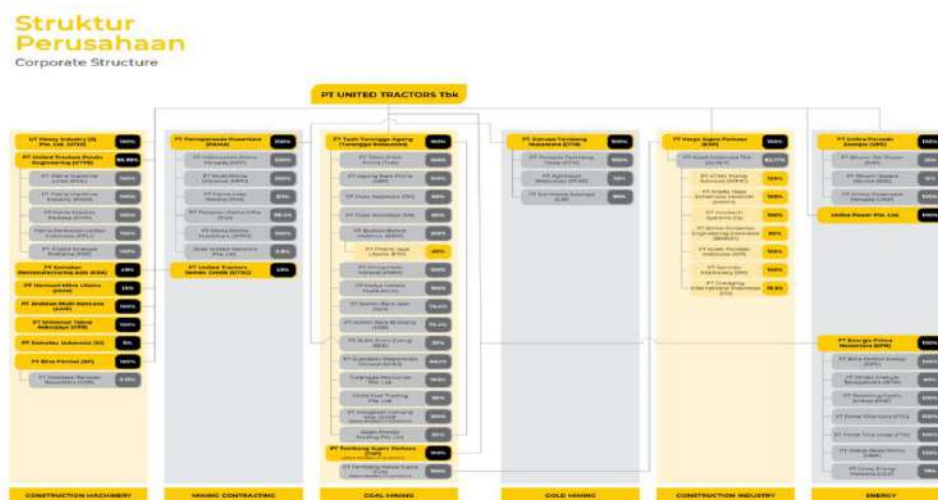

Tapanuli area of North Sumatra province, with a functional area of 479 hectares. Construction of the Martabe gold mine started in 2008 and production began in 2012.

Construction Industry : United Tractors runs the Construction Industry business through its subsidiary PT Acset Indonusa Tbk (“ACSET”). ACSET was founded in 1995 as a multi-specialized construction company providing technical and construction services for building, civil and maritime works. Since 2000, ACSET has experienced rapid growth and is one of Indonesia’s leading building contractors. ACSET has built a strong reputation as a foundation and geotechnical specialist. ACSET’s specialty integrates specialist work and general construction to effectively produce competitive costs. ACSET has completed challenging and prestigious projects such as Pacific Place, Thamrin Nine, Gandaria City, Kota Kasablanka, West Vista Jakarta, Alila Seminyak, Jakarta-Cikampek II Elevated Toll Road, and others.

Energy : In line with its business development strategy in environmentally friendly energy sector, United Tractors has initiated its focus on the New and Renewable Energy (NRE) business as one of its transition strategies in the energy sector. A number of studies, reviews and project realizations in this segment have been carried out. First, the development of Solar Photovoltaic (Solar PV) technology. The Company’s subsidiary engaged in this field is PT Energia Prima Nusantara or EPN. To date, EPN has installed solar PV in a number of companies within UT and Astra group, reaching 1.2MWp. Until end of 2022, it is targeted that there will be additional new installations of 10MWp and will increase in the following year. The Company also conducts studies on the development of several Hydro Power Plant projects with business partners who have a reputation and experience in the field of Hydro Power Plants (PLTA). The potential projects being targeted are in Sumatra and Sulawesi areas, each with a capacity of over 10MW. In addition, the Company has a 25% share ownership in the Tanjung Jati B Power Plant (PLTU) units 5 and 6 in Jepara Regency, Central Java.

As one of the leading companies in its industry, PT United Tractors has a strong presence and a well-established reputation in the Indonesian market. It plays a vital role in supporting the infrastructure development and mining sectors, contributing to the country's economic growth.

Research Objectives

Therefore, in this study, we tried to analyze the Russia- Ukraine war impact on UNTR's financial performance. The analysis for financial performance using several financial ratio, which analy and compare between year 2021 before the war and year 2022 after or during the war. The objective is to analyze how the conflict affected the financial indicators of companies operating in or with significant exposure to volatility of commodities specially the coal price . This could include examining changes in revenue, profitability, liquidity, solvency, and other relevant financial metrics. This study is very useful for those who want to know and assess the quality of UNTR's financial reports in terms of earnings quality and also how well this company preparing for emerging and disruption situations in the global market. Assess the impact of the Ukraine war on the financial performance of companies: Evaluate the resilience of companies in the face of geopolitical risks: The objective would be to understand how companies managed to navigate the challenges posed by the Ukraine war and maintained their financial performance. This could involve examining strategies employed by companies to mitigate risks, such as diversification, cost-cutting measures, or market expansion.

2. LITERATURE REVIEW

Financial Statements Analysis

Financial analysis is the examination of a company's financial statements in order to determine how well that company is doing and to get a sense of how the company can be expected to perform in the subsequent period (Sherman 2015). Has the company's financial position improved, deteriorated, or stayed the same over a period time? Financial analysis is conducted by both internal and external users of financial statements. Internal users such as the company's management employ financial analysis in order to identify potential problem areas that need management attention. External users such as owners and creditors employ financial analysis in order to determine the reasonableness of committing financial resources to the company. For example, owners are interested in the present and future earnings prospects of a business, while short-term creditors may be concerned with the ability of a firm to meet its short-term obligations as they become due. A commonly used technique for evaluating financial statement data is ratio analysis. A financial ratio is a fraction expressing a relationship between financial statement items. To examine the percentage changes in certain financial statement items from period to period, changes in the account balances that are reported in comparative financial statements are compared. This type of ratio analysis is called horizontal analysis. Sometimes we want to compare a financial amount with some total within the financial statements for a single year. This type of ratio analysis is referred to as vertical analysis. A third type of ratio analysis is used to compare one or more items within a set of financial statements to one or more items within the same or different set of financial statements.

Financial Statements

The definition of financial statements in financial accounting standards, according to the Institute of Indonesia Chartered Accountants (2015), is a structured presentation of an entity's financial position and financial performance. A balance sheet, income statement, and cash flow statement are all common components of financial statements. According to Harahap

(2013:105), financial statements are reports that show the current financial position of a company or within a certain period. Financial condition current company, namely the company's financial condition on a certain date (for balance sheet) and a certain period (for the income statement). The report used in this study is according to the financial statement contained in the quarterly report of UNTR's from 2021 to 2022.

Analysis of Financial Statements Analysis of financial statements is an activity that consists of reviewing or studying financial reports in terms of relationships and trends to determine the financial position and results of operations as well as the development of the company concerned (Munawir, 2010). This analysis aims to provide information about the company's performance, financial position and cash flow so that it is useful for certain groups. After the financial statements are made, it is necessary to analyze the financial statements, because by analyzing it can be seen the level of success of a company. Financial ratio analysis is a comparative measure of two specific items in the balance sheet or income statement individually or a combination of the two reports (Munawir, 2010). The ratio itself is a number that shows the relationship between an element and other elements in the financial statements. The relationship between the elements of the financial statements is stated in a simple mathematical form. Financial ratio analysis generally uses liquidity ratios, profitability ratios, activity ratios and solvency ratios.

Liquidity Ratios

According to Brigham and Houston (2010: 134), said that: "Liquid assets are an asset that is traded in an active market so that it can be converted quickly into cash at prevailing market prices, while the liquidity position of a company is related with the question, whether the company is able to pay off its debts when these debts maturity in the following year.

Based on the several definitions that have been disclosed above, it can be concluded that liquidity ratio is a ratio that describes a company's ability to fulfill or pay its short-term obligations in a timely manner.

1. Current Ratio

According to Arief Sugiono and Edy Untung (2008:68), the current ratio is used to find out how far the company's current assets are used to pay off debt current (liability) that will be due/freshly paid. The formula for finding the current ratio is as follows:

$$\text{Current Ratio} = \text{Current Assets} / \text{Current Liabilities}$$

2. Cash Ratio

According to Kasmir (2009:113) that the cash ratio (cash ratio) is a powerful tool used to measure how much cash is available to pay debts. The formula for finding the cash ratio is as follows:

$$\text{Cash Ratio} = (\text{Cash} + \text{Marketable Securities}) / \text{Current Liabilities}$$

Profitability Ratios

According to Sherman (2011), Profitability ratios indicate the success of the company in earning a net return on sales or on investment. these ratios are the ones investors usually look at, because their main concern is a company's ability to earn profits. Profitability ratios generally consist of: return on assets, return on equity, and net profit margin.

1. Return on Assets (ROA)

The return on assets ratio measures the management's ability to earn a return on the use of the firm's assets. The formula for finding the current ratio is as follows:

$$\text{Return On Asset} = \frac{\text{Net Income}}{\text{Total Assets}} \times 100\%$$

2. Return on Equity (ROE)

Return on equity (ROE) is a financial analysis tool to measure a company's ability to generate profits based on a certain capital. Return On Equity can be calculated by the formula:

$$\text{Return On Equity} = \frac{\text{Net Income}}{\text{Equity}} \times 100\%$$

Net profit margin is management's ability to run the company until it is quite successful in controlling the cost of goods/services, operating expenses, depreciation, loan interest and taxes. Net Profit Margin can be calculated by the formula:

$$\text{Net Profit Margin} = \frac{\text{Net Profit}}{\text{Net Sales}}$$

Activity Ratios

According to Sujarweni (2017) activity ratio is the ratio used to measure the level of effectiveness in using company assets or assets, to what extent company assets are financed with debt or financed by external parties (investors or banks). One of the commonly used activity ratios is Total Asset Turnover which shows the comparison between sales and total assets of a company, which describes the speed of turnover of total assets in a certain period. Total Asset Turnover can be calculated by the formula:

$$\text{Total Asset Turnover} = \frac{\text{Sales}}{\text{Total Assets}}$$

Solvency Ratios

Munawir (2010) states that the solvency ratio is a ratio to measure how far a company's assets are financed by debt. The solvency ratio can also be used to measure the spending ability of debt compared to existing capital. In practice, the solvency ratio describes the company's ability to pay interest and other fixed expenses. The solvency ratio consists of: debt to equity ratio (DER), debt to asset ratio (DAR) and long-term debt to equity ratio.

1. Debt to Equity Ratio (DER)

DER is a ratio to measure a company's financial risk by taking into account the amount of debt and existing capital. Debt to Equity Ratio can be calculated by the formula:

$$\text{Debt to Equity Ratio} = \frac{\text{Liability}}{\text{Equity}}$$

2. Debt to Asset Ratio (DAR)

DAR is a ratio to measure the comparison of total assets and debt owned by a company. Debt to Asset Ratio can be calculated using the formula:

$$\text{Debt to Asset Ratio} = \frac{\text{Liability}}{\text{Total Assets}}$$

3. METHODOLOGY

The type of research used in this study is a comparative study that compares data for each variable in all samples used. Comparisons were made to highlight the performance of UNTR's, especially before Ukraine war 2021 and after or during the war 2022 .From the existing financial reports, an analysis of financial ratios was carried out in a span of 2 years for all samples used for further one-to-one comparisons. each other. The population used in this study is a company engaged in the mining sector, which is listed on the Indonesian Stock Exchange. data used in this study is accounting data in the form of financial reports for each sample. The data collection technique used in this research is to use documentation techniques which are carried out through pages that contain the financial reports of companies whose shares are outstanding on the Indonesia Stock Exchange and company website.

4. RESULT AND DISCUSSION

Based on the data collection that has been carried out, it is significantly the coal sector contribute around 90% increasing revenue and net profit in 2022 (see Table 4), The surge in coal prices provided a positive momentum for all commodity-based business segments. The Construction Machinery segment posted revenue of Rp36.5 trillion, up 60% from Rp 22.8 trillion in 2021. Apart from sales of heavy equipment units, this revenue included sales of spare parts and heavy equipment maintenance services which reached\ Rp10.4 trillion, increased by 33% from Rp7.8 trillion in the previous year. The Mining Contracting segment under PT Pampersada Nusantara posted consolidated revenue of Rp47.4 trillion, up 43% from Rp33.2 trillion in 2021. Overburden removal volume increased by 12%, from 852 million bank cubic meters (bcm) in 2021 to 954 million bcm. Coal production reached 116 million tons, relatively the same as in 2021. The Coal Mining segment run by PT Buah Turangga Agung posted revenue of Rp31.1 trillion, up 127% from Rp13.7 trillion in 2021. This revenue came from coal sales of 9.9 million tons, including 2.4 million tons of metallurgical coal, which increased by 10% from 9.0 million tons in 2021.

Source: PT United Tractors Annual Report 2022

The recapitulation of the ratios calculation 2021 and 2022 based on data from UNTR Annual report can be show on below table :

Table-5: Financial Ratios of PT United Tractors 2021 vs 2022

No	Ratio	Year		% Change
		2021	2022	
1 Liquidity				
a.	Current Ratio	2.00	1.90	-5%
b.	Cash Ratio	1.09	0.91	-17%
2 Profitability				
a.	Return on Asset (ROA)	9.7%	16.6%	71%
b.	Return on Equity (ROE)	15.2%	26.0%	71%
c.	Net Profit Margin	12.9%	17.0%	32%
3 Activity Ratio – Asset Turnover		0.71	0.88	25%
4 Solvency				
a.	Debt to Equity (DER)	0.13	0.03	-77%
b.	Debt to Assets (DAR)	0.08	0.02	-75%

Source: Author Calculation from UNTR Annual report 2022

Based on the table above, it can be seen that the Current Ratio of PT United Tractors Tbk (UNTR) experienced a slight decrease in 2022, with a ratio of 1.90 in 2022. Even so, the ratio is still in the ideal range between 1.5 to 3. so it can be said that UNTR still has the ability to fulfill its short-term financial obligations with its current resources company. UNTR recorded a significant increase in Cash Ratio, but in 2022, there will be a slight decrease with a ratio of 0.91. Although ratio figures UNTR is below the expected ideal number (> 0.5), the company still has the ability to pay its short term obligations with cash resources owned.

Return on Assets (ROA) and Return on Equity (ROE) of PT United Tractors Tbk (UNTR) has successful increased, its ROA to 16.67% and its ROE to 26%, showing that the company is

capable utilize its assets efficiently in generating profits. This increase in ROA because the increasing of therevenue and profit which caused by the tremoundoues contribution in revenue and profit of coal mining and mining contracting business segment therefore, it can be concluded that UNTR's ROA And ROE performance in 2022 is good.

The Company's solvency is reflected on its liquidity. Based on the table above, the Total Debt to Equity Ratio (DER) of PT United Tractors Tbk (UNTR) in 2022 is 0.03, which shows the company has a ratio healthy debt to equity. The ideal number of DER is less than 1, that is indicates that the company has a lower amount of debt compared with equity. In this case, UNTR has maintained its debt ratio at a level that has been stable since 2020 and is below the ideal level, indicating that The company manages its finances well and is in a good financial position strong. Based on the table above, the Total Debt to Total Asset Ratio (DAR) of PT United Tractors Tbk (UNTR) in 2022 is 0.02, which shows that the company has Ideal Number (< 1) Good low level of debt in proportion to its assets. The ideal number of DAR is less of 0.5, which indicates that the company has more assets in comparison with the debt. In this case, UNTR has maintained its debt ratio at a low and stable level since 2021 and below the ideal rate, shows that the company has the financial strength and ability to pay debt obligations. It also shows that UNTR has the capacity to obtain additional funding if needed in the future. Therefore, UNTR appear to be in a good financial position and able to survive in the long term.

5. CONCLUSION

The surge in commodity prices caused by the Russia- Ukraine war provided a positive momentum for all commodity-based UNTR business segments. The Construction Machinery segment posted revenue of Rp36.5 trillion, up 60% from Rp 22.8 trillion in 2021. Apart from sales of heavy equipment units, this revenue included sales of spare parts and heavy equipment maintenance services which reached Rp10.4 trillion, increased by 33% from Rp7.8 trillion in the previous year. The Mining Contracting segment under PT Pamapersada Nusantara posted consolidated revenue of Rp47.4 trillion, up 43% from Rp33.2 trillion in 2021.

The Coal Mining segment run by PT Tuah Turangga Agung posted revenue of Rp31.1 trillion, up 127% from Rp13.7 trillion in 2021. This revenue came from coal sales of 9.9 million tons, including 2.4 million tons of metallurgical coal, which increased by 10% from 9.0 million tons in 2021. The surge of coal price give wind fall and also the positive correlation in most of the financial ratios of UNTR, that reflected on the increasing of the profitability ratio (Net profit margin ,ROA, ROE), and also decreasing in solvency ratio (DER and DAR).

6. RECOMMENDATION

Although the Russia-Ukraine war give a big benefit to UNTR's financial performance in 2022, the company should keep aware about the cycle and volatilty of coal price, it will always settle and consilidate with the basic supply and demand, once after the disruption of war is heal, the coal price probably will come back to the "normal" price. Efficient cost management is crucial in maintaining profitability during periods of volatile coal prices. UNTR can review its cost structure, identify areas for cost optimization, and implement measures to control expenses without compromising operational efficiency. Develop a robust risk management framework

6th International CEO Communication, Economics, Organization & Social Sciences Congress

to identify and mitigate risks associated with coal price volatility. This may involve closely monitoring market trends, conducting thorough risk assessments, and developing contingency plans to address potential challenges.

ABSTRACT

Taxi, as one of the transportation moda alternative has been a significant part of people daily mobility lives in Indonesia, helps them to commute from and to another destination especially those who live in the cities. However due to COVID-19 outbreak, taxi industry in Indonesia also encountered a significant hit. In response to the COVID-19 pandemic, the local Government with the approval of the Ministry of Health implemented lockdown and large-scale social restrictions policy includes closing public places, offices and limiting travel from and to the restricted areas. This conditions contributed to reducing demand for taxis order as passenger preferred staying at home or if needed shifting of usage their personal vehicle. In line with the struggling condition, as a market leader in taxi industry in Indonesia, PT Blue Bird, Tbk has adjusted to their business strategy in order to sustained company operational and maintained healthy financial performance to avoided the company from possibility of bankruptcy. This research study aims to analyze and measure the financial health condition and bankruptcy prediction of PT Blue Bird, Tbk with the company's Altman Z-score bankruptcy approach before and during the Covid-19 pandemic in the periods of 2018-2022.

Keywords: Financial Health, Bankruptcy, Altman Z-Score, COVID-19, Taxi Industry

INTRODUCTION

As the first and largest taxi company in the nation, Bluebird (BIRD) is growing its presence in the transportation industry. It serves major cities and well-known tourist destinations like Jadetabek, Bali, Bandung, Cimahi, Batam, Cilegon, Lombok, Manado, Medan, Padang, Pekanbaru, Palembang, Semarang, Surabaya, Yogyakarta, Makassar, and Bangka Belitung. Bluebird Group provides passenger transportation and land transportation services, such as bus rental, car rental, and taxi services (regular and executive).

Bluebird initiated corporate action in 2014 by initiating an Initial Public Offering (IPO) or listing on the Indonesian Stock Exchange as a sign of its dedication to making a long-term contribution to society and meeting stakeholder expectations. Following Bluebird's receipt of an effective statement from the Financial Services Authority on October 29, 2014, the listing and initial public offering of shares took place. This corporate action was made to support Bluebird's goals for company growth and to reinforce Bluebird's position as the industry leader in transportation services, notably in the passenger and land transportation sectors.

The Company has experienced numerous difficulties and significant changes that have come about so suddenly in the last few years, altering the Company's operations. The existence of Special Lease Transportation (ASK), sometimes known as "online taxi", has created new obstacles for businesses in terms of how to compete, how to use technology, and how to adapt to changes in consumer behavior. The rapid emergence of a sizable online taxi industry starting in 2016 has altered the way the company has previously viewed current business practices. By launching Indonesia's first fleet of electric vehicle taxis (EV Taxis), the company also achieved a major milestone in the field of public transportation. By introducing new, cutting-edge, environmentally friendly modes of transportation, the company is demonstrating its commitment to environmental responsibility.

Since the start of 2020, the Covid-19 outbreak has had a substantial impact on a number of industries in Indonesia, including the transportation industry. Because of the limits on commerce and social gatherings imposed by the Central Government and the Regional Government in an effort to stop the Covid-19 virus's spread, the pandemic immediately affects community activities and movement. Due to the sharp decline in market demand in 2020, the transportation industry is consequently under a lot of pressure. This also affects the company, as seen by the revenue the company generated in 2020, which decreased from 2019 and prompted the company to report a loss for the first time in its history. As the new COVID-19 virus variant spread more widely, improvements in the global economy were slowed down. Economic activity was necessarily constrained by the mobility restriction policy that was necessary to stop the spread of new variations. Given the interruptions to Indonesia's transportation sector and the COVID-19 outbreak in recent years, 2022 has been seen as a difficult year. However, BIRD has been able to keep growing and changing in order to offer its clients the greatest mobility options.

LITERATURE REVIEW

Covid-19 In Indonesia

Health around the world had been affected by the COVID-19 pandemic, including Indonesia. Social gathering limitation, which forbids intimate contact between people, may be able to stop the easily spread illness. Many governments in their respective nations implemented national and local lockdown or quarantine policies to make sure their society complied with the health standard. Guidelines for Large-Scale Social Restrictions (LSSR) in the Context of Accelerating the Handling of Coronavirus Disease 2019 were published by Indonesia's Ministry of Health under regulation number 9 of 2020 (Ministry of Health, 2020). Even though these restrictions benefit to the public's health, they unavoidably impact to corporate operations in most sectors. For instance, closed borders have an effect on the hotel industry (Japutra & Situmorang, 2021), due to significant drops in both domestic and international travel, the tourism sector also saw a downturn in its economy (Cahyadi & Newsome, 2021), by the end of the first quarter (Q1) of the year 2020, the pandemic had severely damaged the Indonesian economy (Olivia et al., 2020). The depth of Indonesia's economic crisis is then a result of the pandemic's economic decreases (Miharja et al., 2020).

Impact of Covid-19 In Transportation Industry

The recent financial results of businesses demonstrate how the COVID-19 pandemic has affected the economy. The longer the virus persists, the more of an impact it will have on the economy and business performance, raising questions about the sustainability of debt, particularly for heavily indebted nations and businesses without official backing (Segal & Gerstel, 2020). Both Shen et al. (2020) and Rababah et al. (2020) studies found that Q1 of 2020 had a considerable fall in company performance. The negative impact is more pronounced in sectors and industries with substantial impacts, such as on the production, operation, and sales of the tourism, catering, and transportation industries, as well as in businesses with lower investment sizes or sales revenues.

The transportation sector in Indonesia is one of the sectors that has been significantly affected by the Covid-19 outbreak since the beginning of 2020. This is because the pandemic directly affects community activities and mobility through restrictions on business and social activities set by the Central Government and the Regional Government in an effort to reduce the spread of the Covid-19 virus. As a consequence, the transportation sector is under considerable pressure due to the drastic decrease in market demand during 2020. The effects of the COVID-19 pandemic will last for a long time. However, it is necessary to control it so that public transportation can gradually operate again soon (Dong, Ma, Jia, Tian, 2021).

Public transport is a limited space conducive to the transmission of infectious diseases from human to human. As a result, several countries have reported large clusters of cases on public

transport with infections caused by respiratory viruses, Severe Acute Respiratory Syndrome Coronavirus 2 (SARS-CoV-2) (Shen et al., 2020). This condition makes people have excessive worries when they have to use public transport.

As a country with a large population, Indonesia is undoubtedly quite at risk for the spread of COVID-19. Several times experienced COVID-19 emergencies, which caused restrictions and temporary suspension of public transport services (Olivia, Gibson, & Nasrudin, 2020). As a result, some public transport services in Jakarta experienced a decrease in passengers, resulting in a decrease in service frequency.

Financial Performance

Financial Accounting Standards: Understanding Financial Statements The financial situation and financial performance of a business are presented in a systematic manner, according to the Indonesian Institute Chartered Accountants (2015). Financial statements frequently include the balance sheet, income statement, and cash flow statement. Every business, no matter how big or little, must have regular financial reports, either quarterly or annually, as it is important to understand their revenue and outlay. Understanding financial statements is crucial since they serve a crucial purpose in financial management (Whiteley 2017).

The financial statements in the annual report, which is published on the websites of the company from 2018 to 2022, were used to create the report that was used in this study.

Financial Distress

Ross, Westerfield, and Jaffe (2010:917) define financial distress as a circumstance when a company's operating cash flows are insufficient to cover its present obligations and the company is forced to take corrective action. A company in financial difficulties may default on a contract and may need to restructure its finances with its creditors and equity investors. Typically, the company is compelled to take a step that it would not have done if it had enough cash flow. Insolvency (the inability to pay one's debts) can develop from financial difficulty. Bankruptcy may follow insolvency. Company deal with financial distress in several ways, as follows:

1. Selling major assets
2. Merging with another firm
3. Reducing capital spending and research and development
4. Issuing new securities
5. Negotiating with banks and other creditors
6. Exchanging debt for equity
7. Filing for bankruptcy

Financial distress may involve both asset restructuring and financial restructuring. Financial distress can serve as “early warning” system for trouble.

Bankruptcy

Corporate bankruptcy results from a company's inability to fulfill its financial obligations when they are due. If a business cannot run its operations to reach its objective, it is considered bankrupt. The primary requirements for filing for bankruptcy are that the debtor have two or more creditors and fail to pay at least one debt that has matured and become payable. In such a

case, the debtor will be declared bankrupt by a court order, either at their own request or at the request of one or more of their creditors. Although an insolvent business must find fresh resources to fill the gap, bankruptcy is not always necessary, because it will be required to allocate a portion of its new resources to previous uses.

According to Vernimmen, Quirry, Dallochio, Levur, and Salvi (2014:854), a bankruptcy procedure can enable a corporation to reorganize, frequently necessitating asset sales, a change in ownership, and partial debt forgiveness on the side of creditors. In other situations, bankruptcy results in liquidation, which results in the company's demise. In general, Company experiences a liquidity crisis when it is unable to pay its short-term obligations, however the real description of the financial difficulties that prompted to file for bankruptcy may vary from one to another.

RESEARCH METHOD

This study takes a quantitative, descriptive approach to research. By examining report data, descriptive study using this quantitative approach is carried out. The financial statistics of the company are then calculated to evaluate whether it falls within the category of a healthy or unhealthy corporation. Data was gathered from the company's financial reports, which were published on the Blue Bird (BIRD) Annual Report from 2018 to 2022.

Altman's Z-Score Model And Its Components

Professor Edward I. Altman of NY University in the United States created the well-known Z-score Model in 1968 to determine the likelihood that a company will fail. A multivariate method called the Z-Score Model assesses a company's financial health or distress and forecasts the chance of its collapse (bankruptcy). Altman first created his Z-score model to forecast the collapse of publicly traded manufacturing companies; he later adapted it to forecast failures in private and non-manufacturing organizations. The Multi Discriminant Analysis (MDA) function, often known as the Z-score Model, was developed by Altman in 1968.

$$Z = 1.2X_1 + 1.4X_2 + 3.3X_3 + 0.6X_4 + 1.0X_5$$

Where;

X_1 = Working Capital/Total Assets Ratio;

X_2 = Retained Earnings/Total Assets;^[1]_{SEP}

X_3 = Earnings Before Interest And Taxes/Total Assets;^[1]_{SEP}

X_4 = Market Value of Equity/Book Value of Total Liabilities;^[1]_{SEP}

X_5 = Sales/Total Assets

While there are four common backward-looking ratios (drawn from the financial reports), X_4 (Market worth of Equity) is a forward-looking ratio that takes into account the future worth of the company as perceived by the market (or analysts).

1. Working Capital / Total Assets Ratio (X_1): The net current assets, also known as working capital, of a corporation are measured as a percentage of its total assets, and this ratio essentially evaluates the firm's liquidity situation in relation to its capitalization. Working Capital, which is current assets less current liabilities, aids stakeholders in determining how much capital is

6th International CEO Communication, Economics, Organization & Social Sciences Congress

needed to run a business on a daily basis and how much capital is locked up in working capital. Therefore, if this ratio (working capital to total assets) is high, it would indicate that the company can meet its account payable commitments on time. This could be because receiving income from sales occurs much more quickly than paying for raw materials and other goods and/or services.

2. Retained Earnings/Total Assets (X2): This ratio measures the company's capacity to generate profits from its assets. Most analysts and investors favor a greater Retained Earnings to Total Assets ratio since it indicates that the company is able to retain more earnings. Retained Earnings to Total Assets Ratio of 1:1 or 100% is regarded as optimum. In actuality, however, most organizations are unable to achieve this ratio (1:1). Having this ratio as near to 100% as possible, or at least above average within its industry sector, or improving, would be a more practical goal for most businesses. A greater percentage would show that expansion is being financed by profits rather than by accruing more debt. On the other hand, a low ratio would assume that growth may not be sustainable if it is financed from increasing debts and not by reinvesting the profits

3. Earnings before Interest and Taxes/Total Assets (X3): This ratio is very similar to the Return on Assets (ROA) ratio, which uses net earnings instead of earnings before interest and taxes (EBIT). Operating efficiency is essentially measured by this percentage (all profits before interest and taxes are paid). Operating earnings are considered to be one of the key factors determining the firm's long-term profitability. In other words, this ratio assesses a company's asset productivity and is unaffected by indebtedness or any tax liabilities. This ratio is often viewed by analysts and investors as an indicator of a company's ability to generate income from its assets.

4. Market Value of Equity/Book Value of Total Liabilities (X4): This ratio measures a company's long-term solvency, or the amount the market value of the company would drop before liabilities exceeded assets, if that were to occur. All of a company's current and long-term liabilities are added up to form the book value of total liabilities. Comparatively, the market value of equity is the combined current market value of all common and preferred shares. The only forward-looking ratio used in the Z-score computation is market value of equity, which accounts for the value of future performance of a company and its intangible assets. This is the opposite of the popular debt-to-equity ratio, which is also known as the total debt to total market value of equity or the total liabilities to market capitalization.

5. Sales/Total Assets (X5): This ratio, often known as an assets turnover ratio, calculates how much revenue a company generates by utilizing its assets. This ratio focuses on the assets' and management's ability to generate sales; as a result, the larger the ratio, the better. In other words, a low ratio would suggest that the firm's management and overall assets are ineffective at generating higher sales.

The resulting score is interpreted as follows:

Z-score above 2,99: indicates Safe Zone, a financially healthy company with low risk of bankruptcy

Z-score between 1,80 and 2,99: indicates a company in a Grey Zone with some financial risk

Z-score below 1,80: indicates Distress Zone, a high-risk company with a high likelihood of bankruptcy

When examining companies experiencing financial difficulties, Altman identified five stages of bankruptcy: the emergence of early warning signs (a slight decline in profitability, turnover, or cash availability) that are ignored by the company's management; the obvious manifestation of financial difficulties that are not followed by the adoption of resolution measures in the hope that they will go away on their own; the strong deterrence of financial difficulties that necessitates the adoption of resolution measures; and the final stage of bankruptcy that necessitates the filing for bankruptcy.

RESULTS AND DISCUSSIONS

Several data have been summarized from company's performances from year 2018 to 2022. The data shown are consist of Net Working Capital, Total Asset, Retained Earnings, Earnings Before Interest and Tax, Market Value of Equity, Book Value of Total Liabilities and Total Sales. According to Table.1 below, EBIT of BIRD was decreased significantly during the period of 2019 until 2021, while in the period of 2020, EBIT of BIRD performed in the negative

Table.3 Summary of Company Performances

(in milion Rupiah)

No	Description	Year				
		2018	2019	2020	2021	2022
1	Net Working Capital	456.786	185.270	601.740	801.464	471.568
2	Total Assets	6.955.157	7.424.304	7.253.114	6.598.137	6.893.160
3	Retain Earnings	2.384.410	2.496.205	2.323.464	2.235.054	2.432.221
4	Earning Before Interests and Taxes	606.175	413.962	(290.498)	25.654	484.439
5	Market Value of Equity	5.265.161	5.408.102	5.235.523	5.147.579	5.350.691
6	Book Value of Total Liabilities	1.689.996	2.016.202	2.017.591	1.450.558	1.542.469
7	Sales	4.218.702	4.047.691	2.046.660	2.220.841	3.590.100

Source: Processed by Authors, 2023

Following the above guidelines, we first determined Table. 2 all the ratios needed as input to the Z-score models (X1, X2, X3, X4 and X5) in order to calculate the Z-score for BIRD

Table.4 Calculation Results of Altman Z-score Variable

No	Description	Year				
		2018	2019	2020	2021	2022
1	X1	0,066	0,025	0,083	0,121	0,068
2	X2	0,343	0,336	0,320	0,339	0,353
3	X3	0,087	0,056	(0,040)	0,004	0,070
4	X4	3,115	2,682	2,595	3,549	3,469
5	X5	0,607	0,545	0,282	0,337	0,521

Source: Processed by Authors, 2023

According to Table.3 below, the ratio of Net Working Capital to Total Assets of BIRD in 2018-2022 shows positive value (X1). This ratio is used to measure the ability of BIRD in fulfilling short-term liabilities and measuring the level of liquidity of assets. If company has a positive value working capital shows that the company's ability to pay its bills, whereas has negative working capital, then the company will be having difficulty in fulfilling its current liabilities. This indicates that there is a tendency to have problems serious financial distress.

Table.5 Working Capital to Total Assets

(in million Rupiah)

Financial Year	Net Working Capital	Total Assets	Ratio (X1)
2018	456.786	6.955.157	0,066
2019	185.270	7.424.304	0,025
2020	601.740	7.253.114	0,083
2021	801.464	6.598.137	0,121
2022	471.568	6.893.160	0,068

Source: Processed by Authors, 2023

According to the calculations above, the working capital to total assets ratio is not constant, fluctuating between 0.025 in 2019 and 0.121 in 2021

Then we calculated the Retained Earnings to Total Assets Ratio (X2) of BIRD. The company that have high Retained Earnings show the ability to finance its assets through its profit without utilize their debt. The higher the resulting ratio of retained earnings to total assets means the company has high profits to finance its assets and will reduce the possibility of financial distress

Table.6 Retain Earnings to Total Assets

(in million Rupiah)

Financial Year	Retain Earnings	Total Assets	Ratio (X2)
2018	2.384.410	6.955.157	0,343
2019	2.496.205	7.424.304	0,336
2020	2.323.464	7.253.114	0,320
2021	2.235.054	6.598.137	0,339
2022	2.432.221	6.893.160	0,353

Source: Processed by Authors, 2023

According to the ratio analysis in Table.4 above, Retained Earnings to Total Asset ratio for BIRD has always been positive with a lowest of 0.320 in 2020. It can be stated that the company constantly created and generated profits out of its assets

The Earnings before Interests and Taxes (EBIT) to Total Assets Ratio (X3) calculations for BIRD are shown in Table.5. This ratio is used to measure the ability or productivity of assets in generating profits. The lower the value shows the low productivity of assets in generating profits, the greater the value of this ratio, the more effective of the company manage their assets

Table.7 Earning Before Interest and Tax to Total Assets

(in million Rupiah)

Financial Year	EBIT	Total Assets	Ratio (X3)
2018	606.175	6.955.157	0,087
2019	413.962	7.424.304	0,056
2020	(290.498)	7.253.114	(0,040)
2021	25.654	6.598.137	0,004
2022	484.439	6.893.160	0,070

Source: Processed by Authors, 2023

From the results of the above ratios, showing that the lowest EBIT to Total Assets is -0.040 in 2020 and the one with the highest is 0.087 for the year 2018

The Market Value of Equity to Book Value of Total Liabilities Ratio (X4) for BIRD is calculated next in Table.6. This ratio indicates the company's ability to meet its obligations long-term value of its Equity. The lower this ratio will indicate the smaller the company's ability, and it will increase the possibility of the company in experiencing of financial distress

Table.8 Market Value of Equity to Book Value of Total Liabilities
(in million Rupiah)

Financial Year	Market Value of Equity	Total Liabilities	Ratio (X4)
2018	5.265.161	1.689.996	3,115
2019	5.408.102	2.016.202	2,682
2020	5.235.523	2.017.591	2,595
2021	5.147.579	1.450.558	3,549
2022	5.350.691	1.542.469	3,469

Source: Processed by Authors, 2023

For the past five years that BIRD has been in operation, this ratio has always been positive, with the lowest ratio is 2,595 in year 2020. The aforementioned findings point to a robust market value for stocks.

The Sales to Total Assets Ratio (X5) for BIRD, the final necessary component, was tabulated into Table.7. This ratio, commonly known as the Assets Turnover ratio, measures the volume of sales produced by a company's assets

Table.9 Sales to Total Assets
(in million Rupiah)

Financial Year	Sales	Total Assets	Ratio (X5)
2018	4.218.702	6.955.157	0,607
2019	4.047.691	7.424.304	0,545
2020	2.046.660	7.253.114	0,282
2021	2.220.841	6.598.137	0,337
2022	3.590.100	6.893.160	0,521

Source: Processed by Authors, 2023

The results of the ratios above indicate that the Assets Turnover Ratio ranges from the lowest 0,282 for the year 2020 to the highest 0,607 for the beginning of 2018. This demonstrates an overall good turnover of the company while employing its assets

After all the ratios tabulated and calculated into the formula, Table.8 displays the calculation for Z-score values for BIRD

Table.10 Summary of Altman Z Score Calculation

No	Description	Coefficient	Financial Year				
			2018	2019	2020	2021	2022
1	X1	1,20	0,079	0,030	0,100	0,146	0,082
2	X2	1,40	0,480	0,471	0,448	0,474	0,494
3	X3	3,30	0,288	0,184	(0,132)	0,013	0,232
4	X4	0,60	1,869	1,609	1,557	2,129	2,081
5	X5	1,00	0,607	0,545	0,282	0,337	0,521
6	Z Score		3,322	2,839	2,255	3,099	3,410
7	Zone		Safe	Grey	Grey	Safe	Safe

Source: Processed by Authors, 2023

From the Table.8 above;
1,20 X1 value is 0,079 from the financial year 2018, 1,20 X1 value is 0,030 from the financial year 2019, 1,20 X1 value is 0,100 from the financial year 2020, 1,20 X1 value is 0,146 from the financial year 2021 and 1,20 X1 value is 0,082 from the financial year 2022^[1]_{SEP}

1,40 X2 value is 0,480 from the financial year 2018, 1,40 X2 value is 0,471 from the financial year 2019, 1,40 X2 value is 0,448 from the financial year 2020, 1,40 X2 value is 0,474 from the financial year 2021 and 1,40 X2 value is 0,494 from the financial year 2022

3,30 X3 value is 0,288 from the financial year 2018, 3,30 X3 value is 0,184 from the financial year 2019, 3,30 X3 value is -0,132 from the financial year 2020, 3,30 X3 value is 0,013 from the financial year 2021 and 3,30 X3 value is 0,232 from the financial year 2022

0,60 X4 value is 1,869 from the financial year 2018, 0,60 X4 value is 1,609 from the financial year 2019, 0,60 X4 value is 1,557 from the financial year 2020, 0,60 X4 value is 2,129 from the financial year 2021 and 0,60 X4 value is 2,081 from the financial year 2022

1,00 X5 value is 0,607 from the financial year 2018, 1,00 X5 value is 0,545 from the financial year 2019, 1,00 X5 value is 0,282 from the financial year 2020, 1,00 X5 value is 0,337 from the financial year 2021 and 1,00 X5 value is 0,521 from the financial year 2022^[1]_[SEP]

According to Table.11 below, Altman model Z score Value is 3,322 in the financial year 2018, 2,839 in the financial year 2019, 2,255 in the financial year 2020, 3,099 in the financial year 2021 and 3,410 in the financial year 2022. According to Altman model Z score value is more than 2.99, it indicates that the Company have Safe Zone. The company experienced a decrease in the Altman Z Score starting in year 2019 followed by year 2020 where indicate BIRD in Grey Zone in both year 2019 and 2020. This is influenced by the COVID-19 pandemic, which disrupts the company's operations particularly during year 2020

Table.11 Summary of Z-Score

No	Year	Z-Score	Zone Category	Remarks
1	2018	3,322	Safe	Healthy
2	2019	2,839	Grey	Some Financial Risk, Bankrupt can't easily be predicted
3	2020	2,255	Grey	Some Financial Risk, Bankrupt can't easily be predicted
4	2021	3,099	Safe	Healthy
5	2022	3,410	Safe	Healthy

Source: Processed by Authors, 2023

CONCLUSIONS AND RECOMMENDATIONS

Conclusions

This research is conducted to analyze the financial health and the prediction of PT Blue Bird Tbk whether in the condition Financial Distress and going Bankrupt throughout the past five years before and during COVID-19. Here is the conclusion; from the Altman Z-Score analysis, shows the COVID-19 pandemic that happened in early 2020 had a significant impact on the performance of BIRD. Company had been classified as grey zone, since before the pandemic had started (2019). During the pandemic, the company is still at the grey zone even with lower score (2020). It indicates declining in Company Financial Performance in year 2019 and 2020. The liquidity of the Company to fulfil the short-term liabilities compare to the liquidity of asset represented by lower Net Working Capital in 2019 followed by the significant decrease in generating profit (EBIT) particularly in 2020 took as a caused of lower in Z-Score. Compared to the scores in 2018 (prior COVID-19) and 2022 (after COVID-19 pandemic) have experienced Company performance in Safe Zone respectively.

Furthermore, bankruptcy is not always the result of the confirmed prediction of financial distress in the Company. Only probabilities and circumstances point to potential future failure, but depending on the company's decision and strategy, things could turn around. According to Ross, Westerfield, and Jaffe's (2010) financial distress literature review, reducing capital

spending on new investment and research & development, issuing new securities, and negotiating with creditors are several ways Company might exercise to exit from Financial Distress

Recommendations

The result of this research can be used as input and consideration how to manages and innovates particularly in difficult times for instance, the COVID-19 pandemic or other economic turbulence. Company should be motivated to improve its Financial Performance as a result of this conclusion. According to the analysis of Z-Score, the values X3 and X4 and related to Sales (X5) have the significant impact. For the business to have strong financial performance that enabling to generate sufficient profit, sales growth must be maintained or increased.

By strengthening Company core business portfolio as integrated taxi service, maximizing the opportunity from the need for mobility in personal use which is quite high after pandemic situation, increasing operational effectiveness with; fleet rejuvenation, flexibility in making of booking and payment channels and reorganizing Company financial condition with continues to enhance efficiency and cost management, these are the efforts that Company must focus and experience to generate more profitability in the future.

ABSTRACT

PT. Japfa Comfeed Indonesia is the second largest agribusiness company in Indonesia which was established in 1971. It started to register its business on the Indonesia Stock Exchange with the stock code JPFA in Jakarta and Surabaya. Starting from 1982, the Japfa Group has had a business focus on poultry until recent days. Continuing to expand its business, PT Japfa Comfeed Indonesia also conducted an IPO in Singapore in 2014. The company continues to expand its business from upstream to downstream related to poultry. With the additional investment proceeds from an IPO in Singapore in 2014, PT Japfa Comfeed Indonesia has also begun to expand into fish feed and cattle farming. The Strategy went well and now PT. Japfa Comfeed Indonesia possessed Greenfield as one of the top brands in Indonesia. Under the Greenfield brand, Japfa has exported dairy products. Notwithstanding, since the biggest sales contribution for this company is the poultry industry, when the demand for poultry is decelerating and the DOCs are oversupplied, and most of the raw material prices was increased, the cost of the good sold went high significantly. This condition is mostly because of the perpetration of Large-Scale Social Restrictions due to COVID-19. Along with the core business of PT. Japfa Comfeed Indonesia, this journal's limitation is only for Poultry Industry in Indonesia

This journal will bandy PT Japfa Comfeed Indonesia's resilience to potential bankruptcy using the Altman Z-Score method and dissect data that has been published on its website in the period 2018 up to 2022.

Keywords: Poultry, Japfa Comfeed, Altman Z-Scores, Diversification..

INTRODUCTION

The Organization for Economic Co-operation and Development released data on global consumption of poultry meat. Grounded on the these data (**Table-1**) , consumption of poultry meat in Indonesia was still below Thailand, Philippines, Vietnam, and Malaysia. As a nation with the largest Muslim population in the world, Indonesia still one of the lowest poultry meat consumption per capita (Setjoadi, 2018).

Table-1: Global Meat Consumption 2009-2021

Source: OECD-FAO Agricultural Outlook (Edition 2021)

Indonesia as a country with the fourth largest population in the world clearly needs a food supply that is in line with its population. and to maintain the price stability of the consumption materials of its people, Indonesia needs to have manufactures that can meet these needs eventhough Indonesia’s chicken meat consumption still below the In the attached table, we can see a figure of the per capita consumption needs for several basic commodities of the Indonesian people every week.

Table-2: Average per capita consumption per week of several types of food that are widely consumed by 2021 and 2022.

Jenis Komoditas Bahan Makanan Food Items Commodity	Satuan Unit of Quantity	2021	2022
(1)	(2)	(3)	(4)
1. Beras/Rice	Kg	1,56	1,55
2. Tepung Terigu/Wheat Flour	Kg	0,05	0,05
3. Ketela pohon (singkong)/Cassava	Kg	0,12	0,11
4. Ikan dan udang segar/Fresh fish and shrimp	Kg	0,35	0,37
5. Ikan dan udang diawetkan/Preserved fish and shrimp	Ons/0,1 Kg	0,42	0,42
6. Daging sapi/Beef	Kg	0,01	0,01
7. Daging ayam ras/kampung Broiler/local chicken meat	Kg	0,14	0,15
8. Telur ayam ras/kampung Chicken egg	Butir/Unit	2,28	2,34
9. Susu kental manis Sweetened condensed milk	397 gr	0,07	0,07
10. Bayam/Spinach	Kg	0,06	0,07
11. Pisang/Banana	Kg	0,17	0,17
12. Bawang merah/Shallot	Ons/0,1 Kg	0,56	0,58

20. Gula pasir/Sugar	Ons/0,1 Kg	1,28	1,21

Source: BPS-Statistics Indonesia, National Socioeconomic Survey March 2021 and March 2022

COVID- 19 is a worldwide health issue that began on December 31, 2019, in Wuhan, Hubei Province, China. COVID- 19 was declared a public health exigency of transnational concern by the World Health Organization on January 30, 2020(World Health Organization, 2020). As a result of the exigency, each country has established its counterblockade policy and regulation, performing in a reduction in population mobility(FT Visual & Data Journalism Team, 2021). These regulations, as well as a shaft in COVID- 19 cases have hampered and placed pressure on global profitable growth since numerous companies and businesses have seen a drop in earnings and profit, significantly reducing people’s coping power.

PT. Japfa Comfeed Indonesia, which has been established for more than 50 years in Indonesia, has a complete and comprehensive integrated service concept in almost all of its industrial lines. One of them is the poultry meat industry which is also the biggest business contributor today as seen on **Table-3**. In 2021, with the decline in coping power of society as a whole due to the covid-19 pandemic, in addition companies passing other challenges with availability and price increases in most of raw materials, especially soybean and corn, but at the end of the year, the company can record sales that are higher than in 2020 (Public Expose 2022)

Table-3: FY Sales Contribution per Business Segment. Poultry 89% of Total Business.

1. LITERATURE REVIEW

1.1 Financial Ratio

A financial ratio is a metric for assessing a company's overall financial health. It also provides information on the company's financial accomplishments, which may be used in future financial planning. Liquidity rates, profitability rates, efficiency rates, solvency ratios, content ratios, and market value ratios are the six types of financial ratios. (Daryanto, 2021). The Financial Report in the annual report of PT. Japfa Comfeed Indonesia is the source of data of this study in the period of 2018-2022.

1.2 Financial Distress

According to Sehgal et al. (2021), a corporation is considered to be in financial distress if it exhibits at least one of the following symptoms:

1. Losses passed for a consecutive two years at the company.
2. The value of the company's equity is negative.
3. The DER rate of this company is more than one.

1.3 Bankruptcy

Bankruptcy of a company can be caused by various things, one of which is the continuous increase in production costs. Indicators of Bankruptcy based on Harnanto (2000) in the research of Nurul Mukhlisah (2011):

1. Decrease in sales volume due to changes in tastes or consumer demand.
2. Increase in production costs.
3. The level of competition is getting tighter.
4. Failure to expand.
5. Ineffectiveness in carrying out the function of collecting receivables.
6. Lack of support or banking facilities (credit).
7. The high level of dependence on receivables.

A company that relies on debt in dealing with activities operations and operating activities, will be in a critical condition, because if at one point the company experiences a decrease in operating results then the company will get into trouble inside complete their obligations.

1.4 Altman Z-Score Method

This Z-Score analysis has been used in many countries, including America, Japan, Australia, Canada and France since 1968. However, the Z-score is not used for financial service companies or financial institutions, both private and government. This is because there is a tendency for quite large differences between the balance sheets of one financial institution and those of other financial institutions (Binus 2015).

The discriminant equation is as follows:

$$Z = 1,2X1 + 1,4X2 + 3,3X3 + 0,6X4 + 1,0X5$$

With :

X1 = Working Capital/Total Assets Ratio

X2 = Retained Earnings/Total Assets

X3 = Earnings Before Interest and Tax/Total Assets

X4 = Market Value of Equity/Book Value of Total Liabilities

X5 = Sales/Total Assets

2. METHODOLOGY

This research will using Altman Z-Score as the method as follow:

Working Capital/Total Assets Ratio (X1)

This figure will shown that the company is liquid or not, the figure will be based on their current asset deducted by their liabilities and divided by total assets. Equation as follow :

Table-4: X1 Working Capital/Total Asset Ratio

$X1 = \frac{\text{Net Working Capital (Current Assets - Current Liabilities)}}{\text{Total Assets}}$

Source: Altman (1968), processed by Authors 2023.

Retained Earnings/Total Assets (X2)

This figure shows the company's ability to operate on its own resources, if the ratio of this figure is low, then the company must take other sources of funds from outside the company, for example with a company loan. Equation as follow:

Table-5: X2 Working Capital/Total Asset Ratio

$X2 = \frac{\text{Retain Earnings}}{\text{Total Assets}}$

Source: Altman (1968), processed by Authors 2023

Earning Before Interest and Tax to Total Asset (X3)

This figure will show how well the company can manage its assets. The higher the ratio means the company is able to optimally utilize its assets to generate profits. The Equation as follow:

Table-6: X3 EBIT/Total Assets

$$X3 = \frac{\text{EBIT}}{\text{Total Assets}}$$

Source: Altman (1968), processed by Authors 2023

Market Value of Equity to Total Liabilities (X4)

This figure will provide a ratio that will give you an idea of the equity held by the market divided by the assets held by the company. The higher the ratio, the less the company relies on debt. The equation as follow:

Table-7: X4 Market Value of Equity/Book Value of Debt

$$X4 = \frac{\text{Market Value of Equity}}{\text{Book Value of Debt}}$$

Source: Altman (1968), processed by Authors 2023

Sales to Total Assets (X5)

This figure is to see the asset turnover ratio, where Altman makes this calculation to see the company's ability to face competition in the market. the higher the resulting ratio the better the company's resilience in the market. The Equation as follow:

Table-8: X5 Sales/Total Asset

$$X5 = \frac{\text{Sales}}{\text{Total Asset}}$$

Source: Altman (1968), processed by Authors 2023

From the figures above, we can draw conclusions according to the classification of bankruptcy determination made by Altman as follows:

Z Score >3.0	Safe Zone
2.70 ≤ Z Score < 2.99	Grey Zone, Need More Focus on selected fields
1.80 ≤ Z Score < 2.70	Grey Zone, there is possibility company will have financial distress in the next 2 years
Z Score < 1.80	Distress Zone, there is possibility the company will experiencing bankruptcy

Source: Altman, 1968, processed by Authors, 2023.

RESULT AND DISCUSSION

The following is the financial data presented from the financial statements of PT. Japfa Comfeed Indonesia for the period 2018 to 2022. This research will using Annual Report data which will be a quantitative data from 2018 untill 2022 to see and predict possibility of bankruptcy of PT. Japfa Comfeed Indonesia while the company facing one of the indicator of bankruptcy, Increase in production cost. And the method that will be used in this study is the Altman Z-Score method as follow:

Table-9: Japfa Comfeed Operational Variables 2018-2022.

Description	Year				
	2018	2019	2020	2021	2022
Net Working Capital	5,645	5,131	5,737	7,097	7,589
Total Assets	24,827	26,651	25,952	28,590	32,691
Retain Earnings	6,109	7,267	7,770	9,429	10,231
Earning Before Interests and Taxes	2,918	2,494	1,679	2,794	1,955
Market Value of Equity	10,766	11,897	11,412	13,103	13,655
Book Value of Total Liabilities	14,062	14,754	14,540	15,487	19,036
Sales	36,971	39,626	37,695	45,726	49,905

Source: PT. Japfa Comfeed Indonesia’s yearly report. Processed by Authors, 2023

The data above will be the core data for Altman Z-Score calculation method, which consist of X1 to X5 indicators of the formula. The data shown that some of the figures are not stable from year to year such as “Earning Before Interest and Tax” data that can be decreasing 33% in 2020 compare to 2019 and spike up 66% in 2021 compare to 2020. Let’s breakdown the Altman Z-Score one by one.

1. Working Capital to Total Asset (X1)

The ratio shown below that the X1 ratio in the era of Pandemi (2020-2022) in average still above 2018-2019. So the company in this figure showing a good progress. And have less depending to the loan.

Table-10: Working Capital to Total Assets 2018-2022

Working Capital to Total Assets			
(Billion IDR)			
Financial Year	Net Working Capital	Total Assets	Ratio (X1)
2018	5,645	24,827	0.227
2019	5,131	26,651	0.193
2020	5,737	25,952	0.221
2021	7,097	28,590	0.248
2022	7,589	32,691	0.232

Source: PT. Japfa Comfeed Indonesia’s yearly report. Processed by Authors, 2023

2. Retain Earnings to Total Assets (X2)

As shown in the table below, the ratio of the X2 indicator year on year always increases. this shows that the company is increasingly able to optimize its assets.

Table-11: Retain Earnings to Total Assets 2018-2022

Retain Earnings to Total Assets			
(Billion IDR)			
Financial Year	Retain Earnings	Total Assets	Ratio (X2)
2018	6,109	24,827	0.246
2019	7,267	26,651	0.273
2020	7,770	25,952	0.299
2021	9,429	28,590	0.330
2022	10,231	32,691	0.313

Source: PT. Japfa Comfeed Indonesia’s yearly report. Processed by Authors, 2023

3. Earning Before Interest and Tax to Total Assets (X3)

The calculation of this third indicator shows an unfavorable trend, but there is an anomaly in 2021 while in 2022, the X3 indicator ratio worsens even when compared to the 2020 ratio.

Table-12: Earning Before Interest and Tax to Total Assets 2018-2022

Earning Before Interest and Tax to Total Assets			
(Billion IDR)			
Financial Year	EBIT	Total Assets	Ratio (X3)
2018	2,918	24,827	0.118
2019	2,494	26,651	0.094
2020	1,679	25,952	0.065
2021	2,794	28,590	0.098
2022	1,955	32,691	0.060

Source: PT. Japfa Comfeed Indonesia's yearly report. Processed by Authors, 2023

4. Market Value of Equity to Total Liabilities (X4)

This X4 figure highlights the company's market value, and the figures shown in the table below are the lowest in the past 5 years.

Table-13: Market Value of Equity to Book Value of Total Liabilities 2018-2022

Market Value of Equity to Book Value of Total Liabilities			
(Billion IDR)			
Financial Year	Market Value of Equity	Total Liabilities	Ratio (X4)
2018	10,766	14,062	0.766
2019	11,897	14,754	0.806
2020	11,412	14,540	0.785
2021	13,103	15,487	0.846
2022	13,655	19,036	0.717

Source: PT. Japfa Comfeed Indonesia's yearly report. Processed by Authors, 2023

5. Sales to Total Assets (X5)

This last indicator shows that the company's resilience to competitors is still quite strong, judging by the higher average during the pandemic (2020-2022) compared to before the pandemic.

Table-14: Sales to Total Assets 2018-2022

Sales to Total Assets			
(Billion IDR)			
Financial Year	Sales	Total Assets	Ratio (X5)
2018	36,971	24,827	1.489
2019	39,626	26,651	1.487
2020	37,695	25,952	1.453
2021	45,726	28,590	1.599
2022	49,905	32,691	1.527

Source: PT. Japfa Comfeed Indonesia's yearly report. Processed by Authors, 2023

In calculations using the altman method, it turns out that the ratio of numbers in 2022 is the worst in the last 5 years. Including for 2 years before the pandemic (2018-2019). If we look at the classification using the Altman Z-Score method, where the number of companies in 2022 is 2,871, then the company is likely to face financial distress in the next 2 years.

Table-15: Summary of Altman Z-Score Calculation, period of 2018-2022.

Summary of Altman Z Score Calculation							
No	Description	Coefficient	Financial Year				
			2018	2019	2020	2021	2022
1	X1	1.2	0.273	0.231	0.265	0.298	0.279
2	X2	1.4	0.344	0.382	0.419	0.462	0.438
3	X3	3.3	0.388	0.309	0.214	0.322	0.197
4	X4	0.6	0.459	0.484	0.471	0.508	0.430
5	X5	1.0	1.489	1.487	1.453	1.599	1.527
6	Z Score		2.954	2.892	2.821	3.189	2.871
7	Zone		Grey	Grey	Grey	Safe	Grey

Source: PT. Japfa Comfeed Indonesia's yearly report. Processed by Authors, 2023

CONCLUSION, RECOMENDATION AND LIMITATIONS

1. Conclusion

This research is done to assess financial difficulties to PT. Japfa Comfeed Indonesia

- The result of X1 rate, showing that in 2022, the company has increased liquidity compared to the pre-pandemic period. This means that the company's dependence on debt is decreasing.
- The same as the liquidity rate above, this internal capital rate (X2) also shows very good progress, which needs to be highlighted, the ratio at the time of the pandemic also still showed positive growth.
- This X3 figure shows the trend of the company's unfavorable profitability in the past 5 years. It must be considered what causes the increase in company profitability in 2021.
- In this fourth indicator, the ratio for 2022 is the worst number in the last 5 years, down 15% from 2021.
- Seeing the sales figures on the x5 indicator that are growing consistently, the company in this case is able to compete well with its competitors.
- Financial check on bankruptcy based on the Altman Z-Score method at PT Japfa Comfeed Indonesia in the period 2018 - 2022 produces an average score of 2,946. Based on classification, this figure is included in the gray zone with a note that more focus is needed on several indicators.
- The Altman Z-Score for 2022 is 2,871 where this figure is included in the gray zone classification with a note that there is a possibility of financial distress in the next 2 years.

2. Recommendation

PT. Japfa Comfeed Indonesia looks capable of surviving during the pandemic and even able to get sales figures that have consistent growth, but in terms of EBIT and market value the ratio needs to be considered whether a change in strategy is needed to increase the company's profitability in the future

3. Limitation

6th International CEO Communication, Economics, Organization & Social Sciences Congress

This research will only focus to the data for poultry industry as the core industry of PT. Japfa Comfeed Indonesia. And not include company action such as company acquisition or sale of shares

ABSTRACT

This study aims to find the impact of gender diversity in board of directors, gender diversity in board of commissioners, and audit committee size on tax evasion as measured using the company's ETR (Effective Tax Ratio) with the nominal tax expense divided by earning before tax. Control variable using company size with Ln value of total assets. This research used energy sector companies listed in Indonesia Stock Exchange (IDX) for period of 2014-2021 with a total of 176 that have met the criteria. This research used a purposive sampling method. The analysis technique uses multiple linear regression due to 3 hypotheses being tested. The results of this study show that gender diversity in board of directors, gender diversity in board of commissioners, and audit committee size have no significant effect on tax evasion. Firm size as a control variable has a significant effect on tax evasion, which is the larger the company size, the higher the level of tax compliance.

Keywords: Tax Avoidance. Board of Directors, Board of Commissioners, Audit Committee, Gender Diversity

INTRODUCTION

Up to this point, taxes are still the largest source of state revenue in Indonesia. This statement is in accordance with Chapter 4 paragraph (1) of UU Number 28 of 2007 about General Provisions and Tax Procedures, which defines that taxes are coercive contributions for the state from individuals or entities. The Indonesian tax system adheres to a self-assessment system which indicates that individuals and entities are entrusted with calculating taxes and reporting them independently. This independent reporting creates loopholes that are used by taxpayers to perform tax avoidance (Kusuma Wardani & Nurhayati, 2019).

In 2014 it was found that the ratio of tax revenue was 9.4% of all state revenue which then decreased 0.2% in 2015 and became 9.2%. It continued in the next year, the ratio of state revenue from taxes in 2016 was only 9% and fell again in 2017 to 8.5%. In 2018 there was a slight increase to 8.8% with a realized value of IDR 1,315.9 trillion from the target of IDR 1,424 trillion, but it cannot be denied that the decrease occurred again in 2019 to 8.4% and even more lower compared to 2017. In 2020, the pandemic began to enter Indonesia and gave a hard blow to the economy turnover so that the tax ratio also decreased to 6.9% (Sembiring, 2021). There are several factors that cause a decrease in the ratio of state tax revenues and one of them is the practice of tax avoidance. One of the tasks of top management is to get the highest possible profit to satisfy shareholders. Therefore, the implementation of tax avoidance in companies is influenced by decisions from top management. The difference in interests between the state and companies is clearly visible in the payment of taxes. This is the evidences of the declining in the ratio of state revenue from taxes since 2014.

Tax avoidance practices can be minimized if the company has a good corporate governance. The existence of good corporate governance could keep companies from reducing tax values in a legal way so that they are not included in tax evasion (Putri & Lawita, 2020). Not only the application of GCG, good supervision also needed to be carried out. According to the Indonesian Audit Committee Association, the main task of the audit committee is to assist the board of commissioners to supervise the internal control system, financial reports, and the effectiveness of the internal audit function. In forming the audit committee, approval from the board of commissioners is needed to appoint and dismiss. Therefor it can be concluded that Good Corporate Governance consists of an audit committee, board of directors, and board of commissioners.

Data from the BPS (Badan Pusat Statistik) shows that in 2017 there were around 115 thousand female workers in the energy sector, while there were 1.28 million male workers. The difference in the numbers is because the energy sector is often symbolized as masculinity, so women are considered to be vulnerable and often receive unfair treatment (Kirnandita, 2021). Based on the research by Hudha & Cahyo Utomo (2021) it was found that the size of the board of directors has no significant effect, but gender diversity on the board of directors has a significant effect on tax avoidance. The presence of a female board of directors is considered capable of reducing tax avoidance practices because women have a tendency to avoid risk. It is different from the research of Mala & Ardianto (2021) which stated that gender diversity has no significant effect on tax avoidance. The selection of the board of directors is not based on

gender but on professionalism. Both genders on the board of directors have the same duties and responsibilities, so there is no difference between male and female board of directors.

This research was conducted at companies in the energy sector and used data from the boards of directors, boards of commissioners, and audit committees. The urgency of selecting energy sector companies is that they have made a major contribution to the Indonesian economy (Pratiwi et al., 2020). The upcoming urgency is that tax avoidance practices still occur in Indonesia due to less stringent supervision and many gray areas (Yuliawati, 2019). Therefore the focus of this study is to examine the effect of gender diversity on the board of directors, board of commissioners, and audit committee size on tax avoidance in energy sector companies listed on the Indonesia Stock Exchange.

1. LITERATURE REVIEW

1.1 Agency Theory

Agency theory according to Jensen & Meckling (1976) is an agency contract relationship involving principals (owners) and agents (other people) to run a business. The agent who has obtained the authority from the principal to make decisions can act according to their personal interests. Agency conflicts occur because of differences in interests between principals and agents. The principle wants maximum profits in order to get high returns, but to maximize the profits, certainly, the risks that would be taken are also higher. Therefore, agents choose to make decisions with a low level of risk so that their position in the company remains secure (Ratu & Hermanto, 2020). The problems in agency theory can be reduced by implementing a good corporate governance.

1.2 Good Corporate Governance

A company requires corporate governance to carry out its operational activities. Corporate governance itself is a system used by companies to ensure that company managers' run well and do not violate the law and the rights of shareholders (Purbowati, 2021). This system requires a high supervision in order to run well and can be called as a good corporate governance. Executing the supervision function of good corporate governance consists of board of directors, board of commissioners and audit committee.

1.3 Gender Diversity

Gender diversity proportion is used by the companies to view information and problems from various perspectives. According to Robinson & Dechant (1997), the existence of gender diversity can provide new innovation and creativity for companies. The combination of men and women on the board of directors and the board of commissioners is also necessary because the two genders have different tendencies. Women have a tendency to avoid risks compared to men, so a comparison of the right amount can create good synergy. (Winasis & Yuyetta, 2017)

1.4 Tax Avoidance

Tax avoidance is a practice that performed by taxpayers to reduce the nominal tax paid (Falbo & Firmansyah, 2021). The company's goal from implementing tax avoidance is to reduce

the tax expense that can impact on company profits. Reducing the tax expense can display a higher nominal on company's profit, so that its performance would get better results. The application of tax avoidance is carried out by taking advantage of loopholes in tax regulations (Putri Maidina & Nurlaela Wati, 2020).

1.5 Hypothesis Development

The previous studies have seen the different tendency between men and women on the board of directors in making a decision. Mala & Ardianto (2021) found that gender on the board of directors had no significant effect. The results of this study were also supported by the statement that board of directors was chosen not only based on gender but also in their quality and knowledge. In contrast to the research conducted by Ambarsari et al. (2020) and Sandra (2022) that the presence of women on the board of directors can reduce the company's level of tax avoidance. This is because women have a higher level of tax compliance, according to their characteristics. Agency theory also contributes to gender diversity, because male boards of directors who are more of a risk-takers aTherefore, the appropriate gender combination reduces the percentage of tax avoidance, so that the development of the hypothesis is obtained:

H1 : Gender diversity in board of directors has a significant positive impact on tax avoidance.

The Board of Commissioners is responsible for overseeing the operational activities of the company. According to Melissa & Itan (2022), male members of the Board of Commissioners have more dominant characteristics, while women are more sensitive to their surroundings. The dominant nature of men can lead to differences in interests, as explained in the agency theory. Research results show that gender diversity has a significant impact on tax avoidance, with a negative relationship. This is supported by research conducted by Hudha & Cahyo Utomo (2021) and Jarboui et al. (2020), who claim that an increase in the number of women on the Board of Commissioners leads to a decrease in tax avoidance. Therefore, the following hypothesis is formulated:

H2 : Gender diversity on the Board of Commissioners has a significant negative impact on tax avoidance.

The Audit Committee is a mandatory requirement for companies. This statement is regulated in Peraturan Otoritas Jasa Keuangan number 55 chapter 2, stating that issuers or public companies are required to have an Audit Committee. Furthermore, chapter 4 states that the minimum number of members in the Audit Committee should be 3 (three) individuals who are independent commissioners and external parties to the company. The presence of an Audit Committee can also reduce agency theory practices. Through research conducted by Dang & Nguyen (2022), it was found that the number of Audit Committee members can reduce tax avoidance. However, having too many Audit Committee members can decrease performance efficiency due to more complex decision-making processes. The same results were also found by Fauzan et al. (2019) and (Agustina & Aris, 2017), which stated that the number of Audit Committee members can provide better oversight, leading to a reduction in tax avoidance practices. Therefore, the following hypothesis is formulated:

H3: The size of the Audit Committee has a significant positive impact on tax avoidance

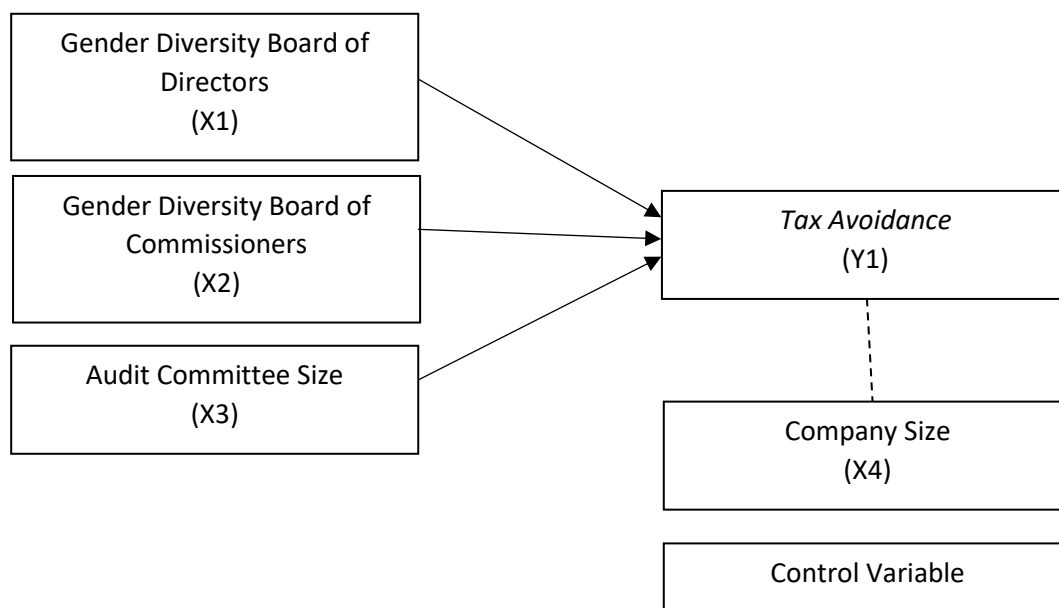

Figure 1. Conceptual Framework

Source: Processed Data (2023)

2. RESEARCH METHODS

This study uses a quantitative method to gather empirical evidence by conducting hypothesis testing. The independent variables of the study are gender diversity in the board of directors (X1), gender diversity in the board of commissioners (X2), and the size of the audit committee (X3). The dependent variable used is tax avoidance (Y1). The data for the study are secondary data obtained from companies in the energy sector listed on the Indonesia Stock Exchange from the period 2014-2021. The method used for analysis is multiple linear regression.

The population for this study consists of companies in the energy sector listed on the Indonesia Stock Exchange. A total of 39 companies in the energy sector were selected as the population. Data from 312 companies were collected for the period 2014-2021, which constituted the population. The data analysis technique used is multiple linear regression. The study was conducted using purposive sampling technique, resulting in a sample of 28 companies in the energy sector. Therefore, the total number of data managed in the study is 176. The sample size was determined based on three criteria: companies in the energy sector listed on the Indonesia Stock Exchange from 2014-2021, classified under the main board, and released annual reports and financial statements during the period 2014-2021.

The type of data used in this study is quantitative data obtained from secondary sources, specifically annual reports and financial statements of companies in the energy sector (Sugiyono, 2018). There are three types of scales used in the research, namely nominal scale, ratio scale, and ordinal scale. The nominal scale is used for the variables gender diversity in the board of directors (X1) and gender diversity in the board of commissioners (X2), while the ratio scale is used for the variable tax avoidance (Y1). Additionally, the ordinal scale is used for the variable size of the audit committee (X3) and the size of the company.

The variables in the study consist of independent variables, dependent variables, and a control variable, which is the size of the company. The independent variables used are within the scope of good corporate governance. The first variable is gender diversity in the board of directors (X1), which is obtained from the company's annual reports by calculating the number of male and female directors. A dummy variable is applied to examine companies with female directors compared to those without. Companies with female directors are assigned a value of 1, while companies without female directors are assigned a value of 0 (Kramer et al., 2006).

The second variable is gender diversity in the board of commissioners (X2), which is derived from the company's annual reports, which indicate the members of the board of commissioners, both internal and external. A dummy variable is applied to examine companies with female commissioners compared to those without. Companies with female commissioners are assigned a value of 1, while companies without female commissioners are assigned a value of 0 (Kramer et al., 2006).

The third variable is the size of the audit committee (X3), which is determined based on the total number of audit committee members, as stated in the company's annual reports. According to the regulations of the Otoritas Jasa Keuangan, the minimum number of audit committee members is 3 (three) individuals.

The dependent variable is tax avoidance. Tax avoidance is measured using the Effective Tax Ratio (ETR) formula, which compares the tax expense with the pre-tax income (Azzahra et al., 2022). The control variable used is the size of the company, which is obtained from the total assets owned. The inclusion of a control variable aims to provide more comprehensive and measurable empirical evidence. The size of the company is measured using the natural logarithm (Ln) multiplied by the total assets (Asnawi & Wijaya, 2005). Multiple regression analysis is used because the study involves more than one independent variable, namely gender diversity in the board of directors (X1), gender diversity in the board of commissioners (X2), and the size of the audit committee (X3). The equation for the multiple regression analysis model is as follows:

$$ETR = \alpha - \beta_1 DWOMAN + \beta_2 CWOMAN + \beta_3 ACS + \beta_4 SIZE + e$$

Keterangan :

ETR = *Tax Avoidance*

α = Konstanta

β = Koefisien variabel independen

ACS = *Audit Comittee Size*

SIZE = *Company Size*

E = *Error*

3. RESULTS AND DICUSSIONS

Table-1: Descriptive Statistics

	N	Minimum	Maximum	Mean	Std. Deviation
Direksi	176	0	1	0.35	0.477
Komisaris	176	0	1	0.19	0.391

Komite Audit	176	3	4	3.15	0.356
ETR	176	0	0	0.12	0.093
Company Size	176	26	32	29.52	1.276
Valid N (listwise)	176				

Source: Processed Data (2023)

The descriptive statistics table provides information about the sample size, minimum-maximum values, mean, and standard deviation of the research variables. This study uses the variables of gender in the board of directors, gender in the board of commissioners, and the number of audit committee members as independent variables. The dependent variable used is tax avoidance, which is calculated using the effective tax ratio (ETR). The last variable is the size of the company, which serves as a control variable.

The test results show a sample size of 176, obtained from the years 2014 to 2021 in energy sector companies based on the sample selection criteria. The independent variable of gender in the board of directors has a minimum value of 0 and a maximum value of 1. The mean value is 0.35, which can be interpreted as 35% of energy sector companies having women on their boards of directors, while 65% of companies do not have gender diversity.

The independent variable of gender in the board of commissioners has the same minimum and maximum values as the board of directors. The similarity in these values is due to the dummy variable method used by the researcher. The mean value is 0.19, indicating that 19% of energy sector companies have women in their board of commissioners, while the remaining companies do not include female commissioners in their board composition.

The independent variable of the size of the audit committee has a minimum value of 3 and a maximum value of 4. The minimum value of 3 aligns with the regulation set by the OJK. The mean value of the variable is 3.15, indicating that 85% of energy sector companies have the same size of the audit committee, which consists of 3 members (the minimum number required). The dependent variable, tax avoidance, is approximated using the effective tax ratio (ETR). The mean value of the variable is 0.12, with a standard deviation of 0.093.

Table-2: Normality Test

One-Sample Kolmogorov-Smirnov Test			Unstandardized Residual
N			176
Normal Parameters ^{a,b}	Mean		0.0000000
	Std. Deviation		0.08694956
Most Extreme Differences	Absolute		0.056
	Positive		0.056
	Negative		-0.043
	Test Statistic		0.056

Asymp. Sig. (2-tailed) ^c	0.200 ^d
Monte Carlo Sig. (2-tailed) ^e	0.183
99% Confidence Interval	0.173
	Upper Bound
	0.193

Source: Processed Data (2023)

The normality test was conducted using the Kolmogorov-Smirnov Test, with a significance level of $\alpha = 0.05$ (5%). If the significance value is greater than α , which is 0.05 in this case, it indicates that the residuals are normally distributed. The results of the normality test show a significance value of 0.183, which is greater than the alpha value of 0.05. Therefore, the normality assumption is fulfilled.

Table-3: Multicollinearity Test

Coefficients ^a	
Variabel	VIF
Direksi	1.017
Komisaris	1.087
Komite Audit	1.043
Company Size	1.120

Source: Processed Data (2023)

The test for multicollinearity examines the correlation among variables in the regression model. VIF values between 0.1 and 10 indicate the absence of multicollinearity. In the table, the variables of the board of directors, board of commissioners, audit committee, and company size have VIF values above 0.1 and below 10. Therefore, it can be concluded that all variables in the study do not exhibit multicollinearity.

Table-4: Heteroscedasticity Test

Coefficients ^a	
Variabel	Sig.
Direksi	0.964
Komisaris	0.214
Komite Audit	0.522
Company Size	0.154

Source: Processed Data (2023)

The heteroscedasticity test examines the inequality of variance in the regression model. If the significance value is greater than $\alpha = 0.05$ (5%), it indicates that there is no heteroscedasticity in the regression model. In the table, all variables have significance values greater than 0.05, which means that there is no heteroscedasticity present in any of the research variables.

Table-5: F-Test

ANOVA^a

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	0.206	4	0.052	6.658	<0.001 ^b
	Residual	1.323	171	0.008		
	Total	1.529	175			

Source: Processed Data (2023)

The F-test evaluates the overall fitness of the regression model in the study. If the significance value is smaller than $\alpha = 0.05$ (5%), it indicates that the regression model is suitable for use. In the table above, the significance value is 0.001, which is smaller than the alpha value of 0.05. Therefore, the regression model is deemed suitable for testing.

Table-6: t-Test

Coefficients^a

Variabel	Sig.
Direksi	0.271
Komisaris	0.740
Komite Audit	0.681
Company Size	<0.001

Source: Processed Data (2023)

The first hypothesis states that gender diversity in the board of directors has a significant positive impact on tax avoidance. Based on the t-test table, the results show that the significance value is 0.271, which is greater than 0.05. This indicates that the first hypothesis is rejected. The research findings suggest that the significance value of the variable is higher than 0.05, indicating that gender diversity in the board of directors does not have a significant impact on tax avoidance. It can be concluded that the presence or absence of women in the board of directors in the energy sector companies does not have an influence on preventing tax avoidance. A study by (Yustin & Effendi, 2021) also found that gender diversity in the board of directors does not have a significant impact on tax avoidance.

Each board of directors possesses equal competencies regardless of gender. The primary consideration in selecting board members is their performance quality, so the appointment of women directors in a company is not solely based on gender but rather on their capabilities. The abilities of the board of directors can also help mitigate conflicts of interest (agency theory). Supported by statements made by (Mala & Ardianto, 2021), serving as a board member requires professionalism and responsibility. Therefore, the prevention of tax avoidance cannot be directly linked to gender diversity.

The second hypothesis states that gender diversity on the board of commissioners has a significant negative effect on tax avoidance. The test results yielded a significance value of $0.740 > 0.05$, leading to the rejection of the second hypothesis. The research findings did not support the second hypothesis (H2). It was found that gender diversity on the board of commissioners does not have a significant influence on tax avoidance practices. One possible reason can be observed from the average percentage of women commissioners, which stands at 19%. This percentage indicates that the energy companies studied still have room for improvement in terms of gender equality, thus resulting in insignificant research findings.

The role of the board of commissioners is to provide oversight and advice to the board of directors. In agency theory, conflicts of interest can occur when the oversight provided by

the commissioners is not stringent enough. Therefore, repetitive advice from both male and female commissioners is necessary. When examining the non-significant results, it can be concluded that advice from both genders has an equal impact. Ultimately, focusing solely on women commissioners is considered to have no influence on the decisions of the board of directors to reduce tax avoidance (Wardani Herlanda et al., 2021). This aligns with the research by Demos & Muid (2020), which found that the presence of women commissioners does not guarantee a high level of oversight in tax avoidance.

The third hypothesis states that the size of the audit committee has a significant positive effect on tax avoidance. The test results yielded a significance value of $0.681 > 0.05$, indicating that the third hypothesis is rejected. This means that the size of the audit committee does not have a significant influence on tax avoidance. The third hypothesis (H3) proposed in the study does not align with the research findings as it does not provide a significant impact. The audit committee size in the research sample ranged from a minimum of 3 to a maximum of 4, with a standard deviation of 0.356. This indicates that the distribution of data on audit committee size in energy sector companies is relatively narrow and tends to have a similar number of committee members. Therefore, the research findings suggest that the size of the audit committee does not have a significant effect on tax avoidance.

The task of the audit committee, according to the Otoritas Jasa Keuangan, is to assist the board of commissioners in supervision and ensure the effectiveness of internal control systems, internal auditors, and external auditors. With two layers of oversight, agency theory regarding conflicting interests can be minimized. The oversight performed by the audit committee can reduce differences in priorities but cannot reduce tax avoidance practices. This statement is in line with the research conducted by Hapsari Ardianti (2019), which states that the number of audit committee members cannot determine tax avoidance practices. Follow-up actions based on the audit committee's reports need to be reviewed to prevent tax avoidance. Therefore, the size of the audit committee cannot provide a significant influence on tax avoidance. The control variable in the study yielded a significance value of $0.001 < 0.05$, indicating that company size has an impact on tax avoidance. The positive direction of the relationship indicates that as the company size increases, the level of compliance with tax payment also increases. To further examine these results, the researcher proceeded with a comparative analysis to determine if there are differences between the compositions of boards of directors and commissioners with gender diversity and those without, or in other words, composed solely of men. The comparative analysis was applied to two variables: the board of directors and the board of commissioners.

Table-7: Independent Sample T-test

		Group Statistics			
	Direksi	N	Mean	Std. Deviation	Std. Error Mean
ETR	Tidak ada wanita	115	0.13	0.094	0.009
	Ada wanita	61	0.11	0.093	0.012

Source: Processed Data (2023)

The total sample size of the study was 176 companies. Out of the entire sample, 115 companies did not have female directors, while the remaining 61 companies had gender diversity in their board of directors composition.

Independent Samples Test

		Sig. (2-tailed)
ETR	Equal variances assumed	0.207
	Equal variances not assumed	0.206

Source: Processed Data (2023)

By using an independent samples test, a Sig. (2-tailed) value of 0.207 > 0.05 was obtained. Therefore, it can be concluded that there is no significant difference between companies with female directors and those without female directors.

Group Statistics

Komisaris		N	Mean	Std. Deviation	Std. Error Mean
ETR	Tidak ada wanita	143	0.12	0.087	0.007
	Ada wanita	33	0.14	0.117	0.020

Source: Processed Data (2023)

The total sample of the study consists of 176 companies. Out of the entire sample, 143 companies do not have female directors, while the remaining 33 companies have gender diversity in their board of directors. The number mentioned is fewer than the number of directors. This implies that energy sector companies are more inclined towards gender diversity in the executive team responsible for running the company, while they prioritize male directors for the role of overseeing and decision-making as commissioners.

Independent Samples Test

		Sig. (2-tailed)
ETR	Equal variances assumed	0.292
	Equal variances not assumed	0.384

Source: Processed Data (2023)

By using the independent samples test, the obtained Sig. (2-tailed) value is 0.282 > 0.05. Therefore, it can be concluded that there is no significant difference between companies that have female commissioners and those that do not.

CONCLUSION

This study aims to examine the impact of gender diversity in boards of directors and commissioners, as well as the size of the audit committee, on tax avoidance in the energy sector companies. The study specifically focuses on energy sector companies because they are often associated with masculinity, which is typically associated with men (Kirnandita, 2021). The data used in this study consists of 176 samples listed on the Indonesia Stock Exchange (BEI) from 2014 to 2021, with the condition that they have published annual reports and financial statements throughout the research period. The results of the study indicate that gender diversity in boards of directors does not have a significant impact on tax avoidance, gender diversity in

commissioners does not have a significant impact on tax avoidance, and the size of the audit committee does not have a significant impact on tax avoidance.

The study has identified several limitations. First, the energy sector companies are predominantly male-dominated, as evidenced by the low percentage of gender diversity in boards of directors (35%) and commissioners (19%) across all energy companies. Therefore, the sample of companies with gender diversity is limited. Second, the tax avoidance assessment indicators rely solely on Effective Tax Rate (ETR) obtained from financial statements, without considering other variables beyond financial reports. Third, the study was conducted until the pandemic period in 2020 and 2021, during which there was a decline in tax values across all sectors. Given these limitations, future research could focus on sectors where boards of directors and commissioners have gender diversity above 50% to examine their effects. Additionally, it is recommended to consider variables beyond financial reports as measures of tax avoidance.

ABSTRACT

The cement industry is an essential for a nation's economy development as this binder is a building material used for infrastructure and commercial buildings. However, despite the rise in domestic demand, several key players in the cement industry from abroad entered Indonesia to establish new plants to develop their market especially players from China, such as PT Conch Cement Indonesia and PT Hongshi. China players who have just entered the Indonesian market are doing penetration by slamming the market price about 40 percent below the local price. Meanwhile, local cement players are more concerned with ensuring long-term business sustainability. Therefore, it is very easy to attract customer to switch from local product to Chinese product. This condition forced local cement companies to slightly reduce their prices, as the result company ended up with slim margin. This study was conducted to analyze the company's financial performance using Return on Assets, Return on Equity, Asset Turnover, Debt Equity Ratios, Financial Leverage, Current ratios and also financial health using the Altman Z-Score method model using the annual report of PT Semen Indonesia during the periods of 2018 – 2022.

The results showed PT Semen Indonesia was in the financial healthy condition, with scores were as follows; 2018 was 3.88; 2019 was 2.51; 2020 was 2.50; 2021 was 2.74 and 2022 was 3.01. It seems PT Semen Indonesia has conduct risks regularly for considering internal and external conditions that may affect the company's long term plans and achievement of company's goals and performances.

Keywords: Financial Health and Performance, Cement Competition in Indonesia, Altman Z-Score

1. INTRODUCTION

Cement industry is a strategic industry that every country needs. Cement is used to support infrastructure development and housing needs.

According to data from the United States Geological Survey (USGS), Indonesia's cement production from 2019 to 2022 domestic cement production is declined, inline with the decline in domestic cement demand. According to the Indonesian Cement Association (ASI), the reasons for the sluggish demand for cement is the delay of many infrastructure projects, especially under the COVID-19 pandemic. In addition, rising fuel prices (BBM) and higher production costs due to inflation dampened demand for cement.

Indonesia Cement Association (ASI) data shows that over half of the country's sales volumes (56%) were in Java, followed by Sumatra (22%), Sulawesi (8%), Kalimantan (also known as Indonesian Borneo, 6%), Bali-Nusa Tenggara (6%) and Maluku-Papua (2%)

Meanwhile, data from the National Bureau of Statistics of China (2022) shows that cement production capacity is predicted will reach 3.3 billion tons in 2021, while cement consumption will only be 2.3 billion tons. Due to the oversupply, China implement several strategies such as industry restructuring, business diversification and expansion into overseas markets.

China began to expand into Indonesia while China knew that from 2000 to 2012 cement industry in Indonesia able to obtain EBITDA margins of up to 40%. China aggressively entering the Indonesian market, such as Conch Cement, Jui Shin, Panasia, Haohan Cement, Cement Hippo or Sun Fook Cement, to Hongshi Holding Group. Anhui Conch Cement Company Limited, which is one of the largest cement companies in China, has a target production capacity of up to 25 million tons. As a result, in recent years, the cement industry in Indonesia has experienced an oversupply condition. This is due to the increase in cement production from these local and global producers. In 2022, cement production capacity in Indonesia will reach more than 110 million tons per year, while cement consumption will only reach 70 million tons per year.

Among Chinese cement player, a subsidiary of China's Anhui Conch become 4th largest producer following Holcim Indonesia. . The price-cutting strategy adopted was able to gain a significant market share in Indonesia.

Table 1. Price List Cement in Indonesia Year 2022

Indonesia Cement Price List in 2022

No	Cement Brand	Quantity	Price
1	SEMEN HOLCIM	40 kg	Rp 51.000
2	SEMEN SCG	40 kg	Rp 42.900
3	SEMEN TONASA	40 kg	Rp 45.000
4	SEMEN BOSOWA	40 kg	Rp 48.000
5	SEMEN PADANG	40 kg	Rp 50.000
6	SEMEN MERAH PUTIH	40 kg	Rp 42.700
7	SEMEN MERAH (SEMEN	40 kg	Rp 500.000/m3
8	SEMEN DYNAMIX	40 kg	Rp 44.500
9	SEMEN ANDALAS	40 kg	Rp 50.000
10	SEMEN TIGA RODA	50 kg	Rp 53.350
11	SEMEN CONCH	50 kg	Rp 49.500
12	SEMEN GRESIK	50 kg	Rp 51.700
13	SEMEN HOLCIM	50 kg	Rp 52.500
14	SEMEN SCG	50 kg	Rp 52.800
15	SEMEN TONASA	50 kg	Rp 55.000
16	SEMEN BOSOWA	50 kg	Rp 58.000
17	SEMEN PADANG	50 kg	Rp 60.000
18	SEMEN MERAH PUTIH	50 kg	Rp 52.700
19	SEMEN TIGA RODA	40 kg	Rp 42.300
20	SEMEN CONCH	40 kg	Rp 40.500
21	SEMEN GRESIK	40 kg	Rp 41.800

Source : Rumah.com 2023

As shown as table 1, Chinese cement sell price below local competitor. For example cement CONCH as biggest china cement in Indonesia sell IDR 40.500 for 40 Kg and IDR 49.500 for 50 Kg, meanwhile PT Cement Indonesia (SIG) sell IDR 41.800 for 40 Kg and IDR 51.700 for 50 Kg. Entering China cement player also give impact to cement market price in Indonesia, since china cement has been circulating, the price of local brand has gradually decreased which indicate PRICE WAR in the market.

In other hand, local cement company PT Cement Indonesia (SIG) still become the market leader in the domestic cement industry eventhough still experiencing oversupply. PT SIG still controls a market with a share around 50% on 2020.

PT Semen Indonesia (Persero) Tbk Operating Performance

1. Capacity

**Table 2. Capacity Production vs Total Production
(in thousand tons)**

Operating Performance	2022	2021	2020	2019	2018
Total Production Capacity	56.450	52.600	52.600	52.600	37.800
Total Production	33.494	35.812	33.935	39.710	30.560

Source : Annual report of SIG 2019 - 2022

In 2022, PT Semen Indonesia (Persero) Tbk recorded cement production volume of 33.49 million tons, 6.5% decrease compared to the previous year.

2. Sales

On the sales side, compared to 2021, it has decreased as shown in the table 3.

Table 3. Cement Sales period 2018 – 2022

Operating Performance	2022	2021	2020	2019	2018
Domestic Sales	31.633	34.092	31.972	36.341	27.421
Regional Sales	5.288	8.317	7.720	6.271	5.750
Domestic Clinker Sls	-	-	157	668	213
Total Sales	36.921	42.409	39.849	43.280	33.384

Source : Annual report of SIG 2019 - 2022

In 2022, the decrease in sales volume is 12.9%, mainly contributed by a decrease in regional sales volume of 36.4% due to the limited availability of coal at DMO prices which prioritized to meet domestic cement needs. For this reason, adjustments were needed to fulfill export volumes. This condition was exacerbated by rising diesel prices and price wars with foreign cement producers who set up factories in Indonesia.

2. LITERATURE REVIEW

2.1 Financial Performance

The analysis of financial statement is a process of evaluating the relationship between component parts of financial statement to obtained a better understanding of the firm's position and Performance (Anthony, Hawkins, and Merchant 2011). Financial ratios are powerful tools used to quantify the risk factors before making any strategic decisions, including investment decisions, as it will provide useful information for investors with a more comprehensive

measure of performance (Arkan, 2016). The higher the financial performance could be reflected by higher the stock price in a stock market (Elliott & Schaub, 2006; Brealey et al., 2007; Tandelilin, 2010).

(Magaladevi, 2015) states that financial ratios are an appropriate evaluation method for measuring the financial performance of a company. (Tarawneh 2006), the financial ratio analysis (FRA) has been applied in Banking industry to examine, evaluate, and ranked based on their performance. To analyze the company's performance ratios usually use such as Return on Assets, Return on Equity, Asset Turnover, Debt Equity Ratios, Financial Leverage, and Current ratios.

1. Return on Asset (ROA)

The Return on Assets ratio measures how effectively a company can earn a return on its investment in assets.

$$ROA = \text{Income} + \text{Interest} (1 - \text{Tax rate}) / \text{Total Assets}$$

2. Return on Equity (ROE)

Return on equity measures how efficiently a company can use the money from shareholders to generate profits and grow the company. ROE is an important ratio for investors to consider its profits.

$$ROE = \text{Net Income} / \text{Shareholders' Equity}$$

3. Total Asset Turnover

Assets Turnover Ratio measures how efficiently a firm uses its assets to generate sales. Higher ratio mean the company is using its assets more efficiently and vice versa.

$$\text{Asset turnover} = \text{Sales Revenue} / \text{Total Assets}$$

Table 4 List of Total Asset Turnover

TATO (%)	Adjustment (days)	Score
TATO > 120	TATO > 20	5
105 < TATO ≤ 120	15 < TATO ≤ 20	4,5
90 < TATO ≤ 105	10 < TATO ≤ 15	4
75 < TATO ≤ 90	5 < TATO ≤ 10	3,5
60 < TATO ≤ 75	0 < TATO ≤ 5	3
40 < TATO ≤ 60	TATO ≤ 10	2,5
20 < TATO ≤ 40		2
TATO ≤ 20		1,2

Source: The decree of Ministry of SOE No. KEP-100/MBU/2002.

As shown as table 4, the higher the ratio of total assets Turnover means the more efficient use of overall assets in generating sales.

4. Debt / Equity Ratio

The debt to equity ratio is a financial, liquidity ratio that compares a company's debt to total equity.

$$\text{Debt / Equity Ratio} = \text{Long-term Liabilities} / \text{Shareholders' equity}$$

5. Financial Leverage

Financial Leverage Ratio indicates company's financial portion (debt and equity) to provide resources (asset) for running company's business. Leverage refers to financing methods of a company and its ability to meet its financial obligations, and it is measured by debt ratios (total debt to total assets ratio), debt to equity ratio, and the profit effect of financial leverage

(Lenka, 2017). This is to determine the use of additional resources that can lead to increase the stock return of a company. However, based on research performed by Abdullah (2013), that he revealed that there is a negative significant impact of Debt to Equity Ratio on Stock Return which elucidates that highly leverage firms have less stock prices as compared to low leverage firms.

$$\text{Financial leverage Ratio} = \text{Assets} / \text{Shareholders' equity}$$

6. Current Ratios

The current ratio is a liquidity and efficiency ratio that measures a firm's ability to pay off its short-term liabilities with its current assets. The higher value will always be the better. The current ratio helps investors and creditors understand the liquidity of a company and how easily that company will be able to pay off its current liabilities.

$$\text{Current Ratio} = \text{Current Assets} / \text{Current Liabilities}$$

2.1.2. DuPont Analysis

Is a framework for analyzing fundamental performance pioneered by the DuPont Corporation in the year 1920s to analyze the different drivers of return on equity (ROE). As characterized by Blumenthal (1998), the DuPont model is a useful framework for visualizing financial information and a good tool for assisting in understanding how operating, financing, and investment decisions impact financial performance (Melwin et al, 2014; Voorhis, 1981). Three major financial metrics that drive return on equity (ROE): operating efficiency, asset use efficiency and financial leverage.

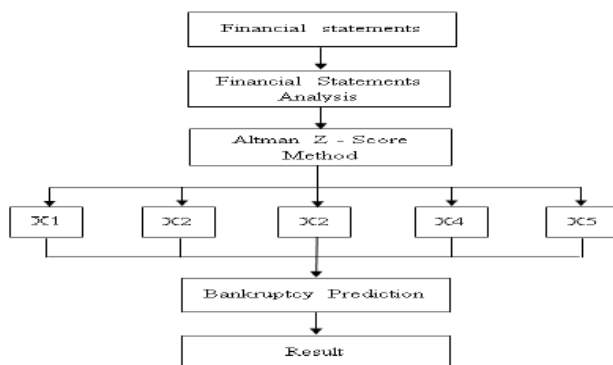

2.1.3. Altman Z-score

Altman Z-score is a multivariable formula for measuring the potential bankruptcy of a company. The score obtained in the calculation is useful for predicting whether a company has a high probability of going bankrupt.

Altman Z-score model is very effective for predicting companies facing financial difficulties. Altman Z-Score (Altman, 1968) which combined a variety of financial ratios into a single score that reflected the likelihood of a firm going into bankruptcy using multiple discriminant analysis (MDA). Z-Score analysis is used to determine whether a company's finances are healthy or not. The greater the Z value, the greater the guarantee for the company's survival and the risk of failure will decrease.

Based on the literature review described above the following framework were proposed for this study:

Table 5 Framework

As shown as table 5, to calculate the Z value, you must first calculate five types of financial ratios (M. Adnan and M. Taufiq, 2001) :

- X1 = Net Working Capital / Total Assets
- X2 = Retained Earnings / Total Assets
- X3 = Profit Before Interest and Tax / Total Assets
- X4 = Stock Market Value / Book Value of Total Debt
- X5 = Sales / Total Assets

On the investor side, evaluating the health of a company is a very important thing to do before investing. Investors will do an analysis before deciding whether the business will be profitable or not. Investors must know the investment proposal with long-term risk that will be accepted (Ananda, Risa & Andika, 2018).

3. Methodology

Steps of Data Analysis Technique

1. The data source comes from the financial statements / Annual Report of PT Semen Indonesia Group (SIG) from 2018 - 2022.
2. Classify the condition of the company according to the category of the Altman Z-score method. Determining the company category . They are bankrupt, vulnerable or healthy.
3. Make conclusions regarding bankruptcy prediction from the results of the data analysis.
4. The financial reports will then be compared to PT Indocement Tunggal Prakarsa (ITP) Tbk as one of its closest competitors in cement industry.

3.1. Research Data

This study uses secondary data. They are data obtained indirectly obtained from annual reports and financial report summaries in the period 2018 - 2022. PT SIG is the companies have been proven to be able to sustain in dealing with the crisis, while many other are facing bankruptcy. For data collection techniques, using documentation techniques by collecting company financial statements, a summary of the company's audited financial statements that have been reported and has been published and can be downloaded.

3.2. Variable

Table 6 List of Variable Study

Total Asset Turnover =	$\frac{\text{Revenue}}{\text{Net Sales}}$	Indicator for cost advantage and profit is taken as the indicator for differentiation advantage
Return on Asset =	$\frac{\text{Net Income}}{\text{Average Total Asset}}$	As an indicator of how profitable a business is relative to its total assets
Return on Equity =	$\frac{\text{Net Income}}{\text{Share Holder's Equity}}$	A measure of how effectively management is using a company's assets to create profits
Debt to Asset Ratios =	$\frac{\text{Total Debt}}{\text{Total Assets}} \times 100\%$	A measurement of a company's financial leverage
Debt to Equity Ratio =	$\frac{\text{Total Debt}}{\text{Shareholder's Equity}} \times 100\%$	A measurement to indicate the relative proportion of shareholders equity and debt used to finance the assets of the
Current Ratio =	$\frac{\text{Current Assets}}{\text{Current Liabilities}}$	An indication of a company's ability to pay short-term obligations or those due within one year
Stock Return =	$\frac{(P_t - P_{t-1}) + D_t}{P_{t-1}}$	Indication of return of a stock. Pt is Stock price at previous period, Pt-1 is the closing stock price at the period (i.e. period t) and Dt is dividend paid at the period t.

Criteria:

Indicator	Year (%)			Standard
	2022	2021	2020	
ROA (%)	2,9	2,5	3,6	5,98
ROE (%)	5,5	5,3	8,2	8,32
Debt to Asset Ratios (x)	20,3	24,9	33,01	22
Debt to Equity Ratios (x)	39,3	52,9	75,3	1 or 100%
Current ratio (x)	144,5	110,6	135,3	>100 and <250
Ttl Asset Turnover (x)	7,9	7,0	6,2	5 - 10

3.3. DuPont Analysis

Three major financial metrics that drive return on equity (ROE): operating efficiency, asset use efficiency and financial leverage. Operating efficiency is represented by net profit margin or net income divided by total sales or revenue and then asset use efficiency is measured by the asset turnover ratio. For leverage, is measured by the equity multiplier, which is equal to average assets divided by average equity.

3.4. Altman Z-Score Method

The Altman Z-score is a multivariable formula for measuring the potential bankruptcy of a company, using the functions of five financial ratios, namely the ratio of profitability, leverage, liquidity, solvency and activity.

The liquidity ratio helps to measure the company’s ability to meet the short-term obligations. The profitability ratio measures the profitbearing capacity of a company. The solvency ratio measures the debt service capacity in the long run and the activity ratio determines the company’s ability to utilize the assets efficiently.

In this formula, the explanation is as follows:

$$Z\text{-Score} = 1,2X1 + 1,4X2 + 3,3X3 + 0,6X4 + 1,0X5$$

X1 gives the liquidity position to the total capitalization,

X2 measures the cumulative profitability overtime and leverages,

X3 measures the operating performance and productivity of assets, X4 gives the long-term solvency position

X4 measure a company's solvency using market value instead of book value

X5 gives the sales generating capacity of the assets.

Explanation :

1. Working Capital Ratio

Working capital equals current assets minus current liabilities. This is used to determine the ability of a company to meet all financial obligations that must be fulfilled immediately, by comparing working capital with total assets.

$$X1 = \frac{\text{Working Capital}}{\text{Total Assets}}$$

2. Ratio of Remaining Retained Earnings

Retained earnings are accumulated net profits that are not distributed to shareholders as dividends. Companies can use it for various purposes, including to pay off debts.

$$X2 = \frac{\text{Retained earnings}}{\text{Total Assets}}$$

3. Earnings Before Interest and Tax (EBIT) Ratio

This ratio indicates profitability, to measure the rate of return that a company generates from its assets.

$$X3 = \frac{\text{Earnings before interest and tax (EBIT)}}{\text{Total Assets}}$$

4. Stock Market Value Ratio

This ratio informs the amount of equity owned relative to the assets owned by the company. The higher the ratio, the less the company relies on debt.

$$X4 = \frac{\text{Market value of equity}}{\text{Total Assets}}$$

5. Sales Ratio

This ratio shows the company's ability to generate income from its assets. The higher the ratio the better the company utilizes its assets to generate sales.

$$X5 = \frac{\text{Total sales}}{\text{Total Assets}}$$

Criteria :

- If $Z > 2,9$ = Safe zone
- If $1,22 < Z < 2,9$ = Grey zone
- If $Z < 1,22$ = distress zone

4. RESEARCH RESULTS AND DISCUSSION

Cement consumption in Indonesia per capita still below the average of Southeast Asian countries, which is around 300 kg per capita and will be grow, estimated 1% per year (source: Annual Report of PT SIG from 2020 – 2022). Cement is over supply.

In 2022, there will be a sizable oversupply of cement and slowing domestic demand, especially for bagged cement, soaring energy prices especially for coal, and management of carbon emissions in an era of climate change.

4.1. Performance Financial Analysis

Based on the PT SIG financial performance, it explained that the company has a good financial performance.

Based on table 7 below, the financial ratios indicate that PT SIG was quite successful in managing assets. This was indicated by the achievement of ROA ratio of 2,9% and ROE 5,5% by end of 2022. These results for both indicators shown in positive growth compare to 2021. In 2022, current ratio was 144.54% or remained above 1x. Moreover, SIG also ensured the availability of working capital loan facility that can be withdrawn anytime as necessary. It means the company has a good ability to meet its short-term obligation. In 2022, the Company recorded an accounts receivable turnover ratio of 6.6x, an increase from 2021. Meanwhile, the average collection period in 2022 was 55 days, faster than the previous year's of 57 days, mainly due to efforts to accelerate receivables collectability. Efforts are carried out to ensure efficient receivables collections, among others by optimizing the use of Distributor Financing facility provided to the Distributor, as well as Bank Guarantee to provide certainty in receivables collectability of SIG.

Table 7 SIG Financial Ratio 2020 - 2022

Semen Indonesia Group	Year			Average
	2022	2021	2020	
Return on asset (ROA) (%)	2,9	2,5	3,6	3,0
Return on Equity (ROE) (%)	5,5	5,3	8,2	6,3
Debt to Asset Ratios (x)	20,3	24,9	32,99	26,1
Debt to Equity Ratios (x)	39,3	52,9	75,3	55,8
Current ratio (x)	144,5	110,6	135,3	130,1
Total Asset Turnover (x)	7,9	7,0	6,2	7,0

Source : Annual report of SIG 2020 – 2022

As a market leader, PT SIG remains focused on maintaining profitability and ensuring the health of the industry.

Acquisition of profit for the year amounted to Rp2,499 billion in 2022 is the result of efforts to minimize the impact of competition and lower demand for cement on the revenue. The company’s debt ratios level is also in a safe position, because the value of the company’s total debt is still below the company’s assets.

As shown as table 7 above show PT SIG capability in fulfill its debt obligations, both short and long term. PT SIG solvency ratios shows better figure compared to last year in line with the decrease in interest-bearing debt balances during 2022.

PT SIG measures its short-term solvency by using current ratio was 144.54% or remained above 1x. In 2022, SIG recorded a ratio of interest bearing liabilities to Equity of 39.30%. Ratio of interest-bearing liabilities to EBITDA of 2.11x. Its better compared to year 2021 due to the acceleration of debt repayment by the Company during 2022.

The SIG Group must maintain a current ratio greater than 100%, leverage less than 250%, and Profit Before Tax Interest Depreciation Amortization (EBITDA) divided by interest greater than 150%, calculated based on consolidated financial statements. This is required by PT Bank Mandiri (Persero) Tbk, which provides a Short Term Credit Facility.

Table 8 PT SIG Valuation Ratio

Source : SIG Financial Review

As shown on the table 8, The P/S or P/E Ratio is a financial metric that measures how much investor are willing to pay for a company's earnings or sales. It can help investors to compare different companies and industries, and to identify potential opportunities or risks in the stock market.

Usually P/E less than 20 is considered low and indicates that the company is undervalued, 20-25 is a normal P/E Ratio, P/E values more than 25 are considered as high and indicates that the company is overvalued.

Table 9 Performance and Margin

Source : SIG Financial Review

Revenue and profits can tell us a lot about the condition and strategy of the company.

As shown as table 9, The profit margin is increasing, it may mean that the company is reducing its expenses, increasing its prices, or improving its quality or productivity.

SIG did not have any issues on shares trades, both on suspension or delisting, which indicates the Company's compliance with prevailing laws and regulations in Indonesia, specifically related to the Capital Market.

With a healthy financial position, SIG is able to distribute dividends to shareholders in the amount of IDR 1.02 trillion or 50.66% of the total net profit attributable to owners of the parent entity for 2021.

Table 10 PT ITP Tbk Financial Ratio 2020 – 2022

PT Indocement Tunggak Prakarsa (ITP) Tbk	Year			Average
	2022	2021	2020	
Return on asset (ROA) (%)	7,10	6,70	6,60	6,8
Return on Equity (ROE) (%)	9,2	8,4	8,0	8,5
Debt to Asset Ratios (x)	0,24	0,21	0,19	0,2
Debt to Equity Ratios (x)	0,31	0,27	0,23	0,3
Current ratio (x)	2,14	2,44	2,92	2,5
Total Asset Turnover (x)	1,57	1,77	1,93	1,8

Source : Annual report of ITP 2020 – 2022

Based on table 10 above, the financial ratios indicate that ITP was quite successful in managing assets. This was indicated by the achievement of ROA ratio of 7,10% and ROE 9,2% by end of 2022. These results for both indicators shown in positive growth compare to 2020. In addition, the company is also in a safe position for its cash flow, this is indicated by the high liquidity ratio which reached 2,92 times in 2020 and 2.14 times in 2022. It means the company has a good ability to meet its short-term obligation.

4.2. DuPont Analysis

Return on equity of PT SIG was considered healthy as the ratios in 2022 is grow by 5,5% compare to prior year of 2021.

DuPont Analysis :

- 1. Operating efficiency/ROA** - Operating efficiency is represented by percentage of profit margin using net income divided by total net sales. Net profit margin growth of PT SIG by 1 % (from 5,58 % in 2021 to 6,50% in 2022).
- 2. Asset use efficiency/Total Asset Turn Over** - Asset use efficiency is measured by the asset turnover ratio or net sales divided by total assets. , SIG recorded a good level of receivables collectibility as measured by the accounts receivable turnover ratio and the average

collection period. Company recorded an accounts receivable turnover ratio of 6.6x, an increase from 2021. Meanwhile, the average collection period in 2022 was 55 days, faster than the previous year's of 57 days, mainly due to efforts to accelerate receivables collectability. It can be concluded that PT SIG was already efficiently in utilizing its assets to generate sales.

3. **Financial Leverage/ debt to equity ratio-** The debt to total assets ratio is an indicator of financial leverage of a business. The higher the ratios of debt to total assets, the greater the financial leverage and it means the greater the risk. The average of debt to total asset ratios for 3 years from 2020 – 2023 is 26,1%. This could indicate that total of debt is 20,3% of the total assets in 2023.

Table 11 Average of 9 Quartes of PT ISG Financial Result & vs ITP

Average (9 Qt)	DuPont	SIG	ITP	ISG vs ITP
Return on asset (ROA) (%)	Operating Efficiency	2,99	6,80	3,81
Return on Equity (ROE) (%)	Profitability	6,32	8,53	2,21
Debt to Asset Ratios (x)		26,05	0,21	25,84
Debt to Equity Ratios (x)	Leverage	55,84	0,27	55,57
Current ratio (x)		130,14	2,50	127,64
Total Asset Turnover (x)	Asset Use Efficiency	7,05	1,76	5,29

Compare with its competitor ITP, the average ROA/Operating Efficiency for last 3 years showing that PT SIG is lower by 4.3% but PT SIG is quite successful managing the financial performance. Furthermore, in terms of ROE, PT ITP is slightly lower by 3.70% compare to PT ITP.

3. The Altman Z-score Analysis

In evaluating the soundness of a company, the Altman Z-score is one of the measurements to predict the possibility of a company going bankrupt.

The results of the Altman Z-score analysis indicate the level of financial health of the company. A Z-score above 2.99 indicates that the company is in health condition. A score between 1.88 and 2.29 indicates that the company's financial health is in a gray area and most likely at a critical juncture. Also, if the Z-score is less than his 1.8, it means the company is likely to go bankrupt.

Based on the Altman z-score table below :

Table 12 Altman Z-Score Assessment of Semen Indonesia

Year	2022		2021		2020		2019		2018	
	Z-score	Zone	Z-score	Zone	Z-score	Zone	Z-score	Zone	Z-score	Zone
Score	3,01	Safe	2,74	Grey	2,50	Grey	2,51	Grey	3,88	Safe

The result above shows that in general the PT SIG is financially sound.

The results showed PT Semen Indonesia was in the financial healthy condition, with scores were as follows; 2018 was 3.88; 2019 was 2.51; 2020 was 2.50; 2021 was 2.74 and 2022 was 3.01

In year 2020 PT SIG in a lowest score due to the oversupply, Covid-19 and the related to the increasingly aggressive low-priced players using a price reduction strategy. Condition in 2021

getting better. Domestic cement sales volume increased 0.6%, while domestic cement and clinker sales volume increased 0.1% compared to the previous year.

CONCLUSION

1. Based on the Altman Z-score, result of PT Semen Indonesia in safe zone in 2022 and 2018 in safe area (more than 2,99). It means that PT Semen Indonesia (Persero) Tbk is not in a bankrupt. Nevertheless, on form 2019 – 2021 which in the grey area has a low possibility experiencing of bankruptcy.
2. The prospect of cement industry is still promising despite current oversupply in the industry. The potential growth in cement demand is also expected to come from a multi-year project to build Indonesia's new capital city in East Kalimantan.
3. SIG continues to monitor receivables balance and billings periodically by optimizing the use of Distributor Financing facility provided to the Distributor, as well as Bank Guarantee to provide certainty in receivables collectability of SIG.
4. Domestic cement sales volume was 31.6 million tons, down 7.2% from the previous year, in line with the decline in national cement demand. An increase in the realization of profit for the year.
5. Diversification by seeking new market opportunities and innovation for PT Semen Indonesia (Persero) Tbk to apply various green technology innovations. In the long term, this effort will not only reduce emissions, but also significantly improve efficiency and productivity.
6. The imposition of a special coal price of US\$ 90 per ton for all industries in the country, except for the metal processing and refining (smelter) industry by the Ministry of Energy and Mineral Resources (ESDM) has had a direct impact on cement issuers' shares. By slopping the price of coal which is on the biggest component in the cost of cement production. The cement has potential to grow this year. This was driven by an increase in the infrastructure budget by 7,8% YoY to IDR 392 trillion and the construction of a new National Capital City (IKN).

ABSTRACT

Artificial intelligence (AI) has recently impacted global businesses' accounting and financial reporting systems. Artificial intelligence (AI) has been leveraged to enhance the precision of financial reports, automate tedious and repetitive tasks, minimize accounting expenses, and establish a more expeditious and efficient accounting infrastructure. However limited research had been conducted specifically on how AI has impacted the accounting and financial reporting system. This research aimed to analyze how artificial intelligence AI has influenced accounting organizations' efficiency and productivity. The investigation focused on, accountants, including managers in accounting, is using a descriptive research approach. The data required for the investigation I gathered using a structured/semi-structured question. Interviews with industry professionals, a review of pertinent academic literature and direct observations are the triangulation providing the data for the study. The use of artificial intelligence was found to have a positive impact on the efficiency of accounting and financial reporting processes. Artificial intelligence was found to have boosted the accuracy of financial reporting, decreased the need for manual labor, and streamlined the recording and analysis of transactions. AI was found to have improved the accuracy and reliability of long-term planning and cash flow forecasting. Researchers suggested that accountants and accounting companies regularly update their AI knowledge to boost the efficiency of accounting processes and reduce associated costs.

Keywords: Artificial Intelligence, Accounting, Financial Reporting, Efficiency, Accuracy.

INTRODUCTION

The emerging and novel field of artificial intelligence (AI) has recently attracted much attention. Artificial intelligence (AI) trains computers to detect, analyze, and respond appropriately to enable machines to mimic human behavior, particularly cognitive capacities (Tyagi, 2022). Artificial intelligence (AI) systems cannot entirely replicate a human's intelligence despite its power, precision, and occasional capacity to outperform human performance. AI can use big data that computers can only process to provide insights (Ryan, 2021). AI relies on machine learning to gather vast data from multiple sources and find basic patterns and relationships (Van Der Merwe & White, 2022). Financial accounting is incomplete without financial reporting based on the accounting cycle.

According to Chart 1 below, financial reporting includes entering a sizable amount of data from several sources to produce crucial financial statements and reports for various stakeholders. (Van Der Merwe & White, 2022). For publicly listed organizations, in particular, these financial reports must adhere to regulatory standards. Because it requires a lot of data and repetitive processes, it is time-consuming and expensive for organizations. Accounting specialists have long tried to employ modern technologies to speed up data processing and cut costs and time on arduous procedures. With no adverse effects on the bottom line or regulatory compliance, this has helped them attain efficiency and effectiveness in these operations.

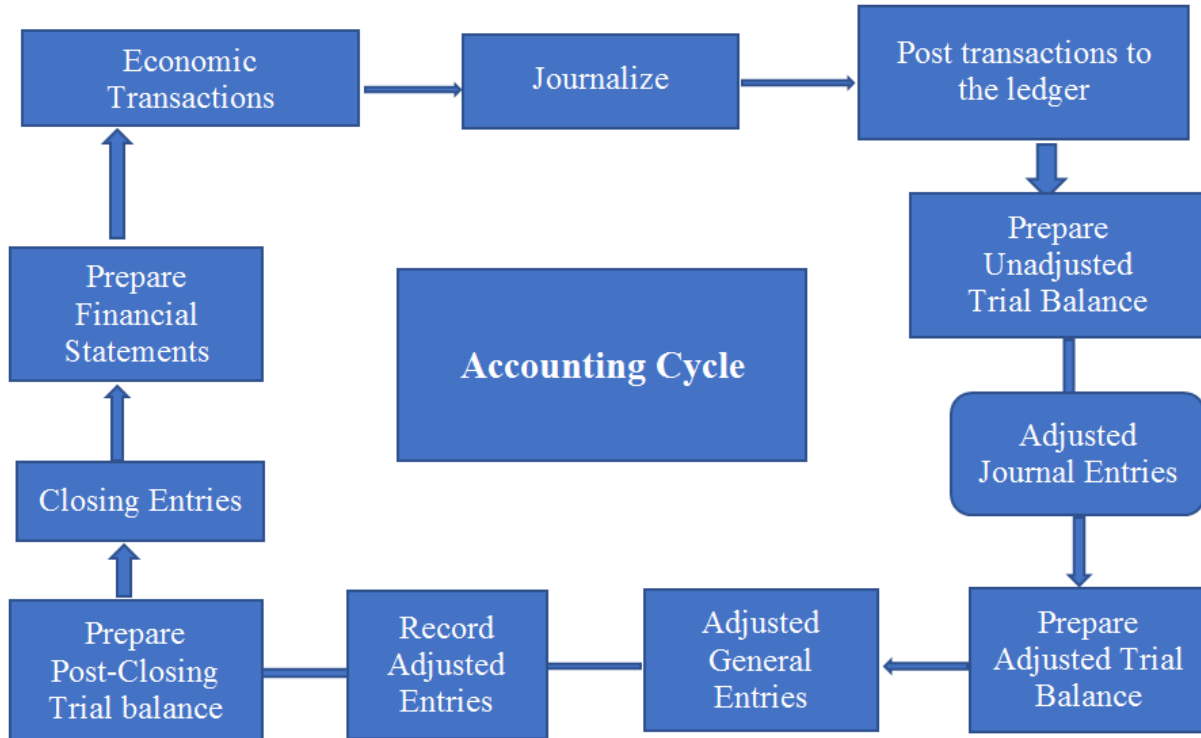

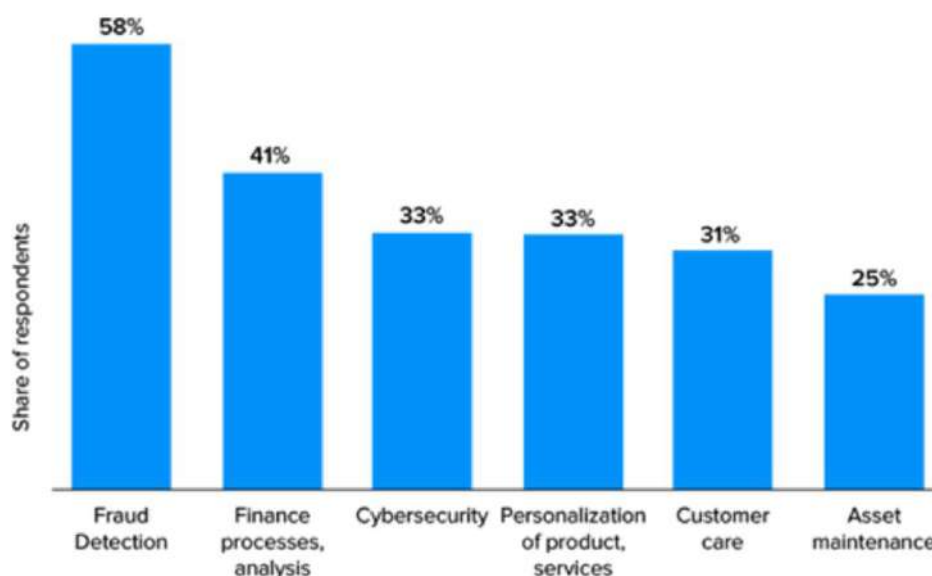

Chart 1. Accounting Cycle Process

The financial statements result from a collaborative effort between accounting staff and management. The auditor's role remains unchanged; they are tasked with lending trustworthiness to any information management releases that are not submitted to an independent audit.

Artificial intelligence applications in the global banking sector as of 2020

(AI Usage Financial Services Worldwide 2020, n.d.)

Most respondents say that the most effective application of artificial intelligence in the financial services sector is the improvement of fraud detection. To better understand client behavior, artificial intelligence enhances fraud detection by integrating supervised learning algorithms with unsupervised learning. Organizations can better spot and stop illicit activity with a deeper understanding of customer behavior.

LITERATURE REVIEW

Distinctive Financial Reporting Requirements

Financial reporting is a procedure that produces financial reports based on the firm's operations (Kieso et al., 2019). Financial reporting gives stakeholders an accurate picture of a company's finances, including sales, costs, profits, capital, and cash flow (Muntean et al., 202). Formal records also provide detailed insights into financial information. These financial reports are made available to all firm stakeholders, both internal and external. These financial reports include cash flow statements, comprehensive income statements, equity statements, and financial position statements. Note disclosures include the president's letter, supplemental schedules, prospectuses, government filings, management predictions, and more (Kieso et al., 2019). These reports are required to adhere to generally accepted accounting principles (GAAP) and commonly used accounting regulations. GAAP is required for these reports to be helpful. All businesses provide financial statements for different customers of financial information.

6th International CEO Communication, Economics, Organization & Social Sciences Congress

But after being audited in compliance with legal standards, publicly traded corporations must publish yearly and quarterly earnings reports.

Being responsible to stakeholders

Stakeholders are direct stakeholders in the financial reporting process (Kieso et al., 2019). Those involved in or affected by the financial reporting process are considered stakeholders. This includes those involved in or affected by the preparation, use, examination, auditing, or monitoring of financial information. Every stakeholder in the reporting process is responsible for a unique task (Kieso et al., 2019). The financial reporting involves numerous stakeholders, including creditors, shareholders, management, securities commissions, stock exchanges, analysts, credit rating agencies, auditors, standard-setters, etc. For instance, to manage resources, creditors and investors rely on financial information; among other things, economic analysts and regulators help in resource allocation. Management creates financial statements, and auditors check them for GAAP compliance to provide them credibility. Financial statements for publicly traded companies must be audited. The difficulties that result from the principles-based rather than a rules-based approach to GAAP must be handled by those who develop accounting standards.

Despite favoring a rules-based approach, US GAAP has two shortcomings and a tendency to be prescriptive. Corporations can adopt accounting techniques they deem fit without restrictions if they take the rules literally (Kieso et al., 2019). Users might not receive the most critical information from this method. GAAP's principles-based approach requires adapting them to specific business scenarios. Instead of right and incorrect responses, the principles-based approach emphasizes professional judgment. This strategy focuses on a unified collection of complete and adaptable concepts to manage varied business situations.

Accounting Predictions and Expert Judgment

Unquantifiable objects are measured through accounting estimations. Some financial statement items need to be approximated because of measurement uncertainty. It's an estimate used in accounting. Accounting projections are subject to error and depend on expert judgment. in 2021 (Petkov). Due to managerial bias and estimating uncertainty, accounting estimates may be materially misstated. Sensitivity research, retroactive reviews, and challenging assumptions can reduce accounting estimate risks. It's crucial to disclose estimations. Auditors must be happy with the methodology, assumptions, and framework to accurately estimate a company's financial accounts (Petkov, 2021). They must also assess the estimates' aggressiveness or conservatism. Accounting estimates include warranties, goodwill, depreciation methods, valuable life, contingent liabilities, pensions, inventory, credit losses, bad debts, and more (Petkov, 2021).

Principles-based accounting allows expert judgment and adoption of accepted accounting concepts (Ivan, 2021). It better serves business, markets, and the public interest since transactions' economic essence can be accurately represented. Ivan provided several scenarios in which professional judgment is required at the accounting policy and measurement levels. For instance, when deciding how much something is worth, accountants must weigh the pros

6th International CEO Communication, Economics, Organization & Social Sciences Congress

and cons of various valuation methods. Since machines cannot make judgments, humans must utilize their brains to make them. Deductive thinking, emotive expression, professional skepticism, and assessment are human abilities (Ivan, 2021). The data's true story is lost if machines make these decisions instead of humans. Machines do not always substitute human skills and professional judgment. A machine cannot learn courage, empathy, or body language. AI cannot replicate the human brain's unique, non-repetitive professional determinations.

Emerging Technologies and AI

The technologies are blockchain, cloud accounting, and RPA, most often mentioned in the literature on AI systems' possible use in financial reporting (Pimentel & Sinha, 2020). Blockchain technology is a peer-to-peer network with a shared ledger, cryptographic keys, and a computational method for online transactions and record storage. Blockchain technology's three differentiating property is immutability. Pimentel and Sinha (2020) recommend removing intermediaries and using a consensus mechanism to speed up accounting transaction publication. Furthermore, these transactions will be self-executed by smart contracts employing encryption. Universal entry bookkeeping will take the role of the current quadruple entry bookkeeping method, enabling each participant to record transactions faithfully, verifiably, and uniformly (Pimentel & Sinha, 2020).

Türegün (2022) examines Amazon Go's use of AI and the pros and cons of using blockchain for financial reporting. Accounting at Amazon Go uses AI. According to Türegün (2021), The combination of blockchain's distributed database technology with AI can change business processes by handling massive amounts of data, acting as a notary, summarizing data accurately, making it replaceable without human labor, reviewing data from several perspectives, and more. Blockchain-based financial reporting has several limitations (Coyne & McMickle, 2021). For example, unlike traditional monetary transactions, which are recorded in ledgers, blockchain-based digital currencies do not exist outside the blockchain, making verifying transactions more difficult.

CONCLUSION

In conclusion, the advancements in technology have indeed brought numerous benefits to business operations, including the accounting field. The use of high-speed data processing, AI, blockchain, RPA, and cloud accounting has improved the accuracy, efficiency, and effectiveness of accounting processes. AI, in particular, has shown promise in mimicking human cognitive functions and has been applied to various accounting activities.

Financial reporting, which is a crucial aspect of accounting, has seen initiatives to integrate AI technology. However, it is important to consider the ethical implications and potential drawbacks of relying solely on AI for financial reporting. AI's ability to mimic human thinking and emotions is still a subject of debate, and AI reports may not be covered by accounting requirements. Trust and control over AI systems will play a significant role in determining how and when AI is used for financial reporting.

ABSTRACT

Generation Z is the most recent wave of young professionals to enter the workforce, and they are becoming an increasingly essential part of industry. Gen Z will soon dominate Indonesia's generation and there is a phenomenon that this youngest workforce cohort has higher turnover rate compared their previous generation. As a result, it is critical to develop a leadership style that encourages employee engagement among this generation in order to promote employee engagement among this generation to reduce turnover. However, there has been limited study examining perceived organizational support as mediating effect between authentic leadership toward turnover intention in Indonesia. Therefore, this study aims to investigate the effects of authentic leadership as an important leadership characteristic that may lower turnover intention, as well as how perceived organizational support may have a mediating effect on turnover intention among Gen Z. The research is a quantitative study that was conducted using SmartPLS4 and a purposive sampling technique. An online survey with a questionnaire created using Google Forms and scored using 5-point Likert scales is used to gather data. The respondents were 116 Generation Z employees born between 1995 and 2012 in Jakarta, Indonesia. According to this study, authentic leadership has a low direct effect on turnover intention, but with the mediating variables of perceived organizational support, authentic leadership has a considerable and significant negative effect on turnover intention.

Keywords: Authentic Leadership, Perceived Communication Style, Turnover Intention, Generation Z, GenZ

1. INTRODUCTION

Generation Z is the latest wave of young professionals entering the workforce and is becoming an increasingly large part of the workforce. According to Gallup, Generation Z, and millennials now account for nearly half (46%) of the full-time workforce in the United States (O'Boyle, Ed, 2021). A new generation entering the workforce frequently draws comparisons to those who came before, and in most cases, this latest generation has the potential to disrupt the workforce. The arrival of the most recent generation, Gen Z, is no exception. Indonesia's workforce reached 144.01 million in February 2022, accounting for 69.06% of the total working-age population of 208.54 million. In this context, the proportion of Gen Z in the workforce has risen steadily, accounting for 17.18% (aged 25-29) and 15.31% (aged 20-24) of the Indonesian workforce population in 2021. The age group of 30-34 years was followed by 16.89 million people, and the age group of 35-39 years was followed by 16.78 million people.

Research shows that Gen Z workers are more likely than earlier generations to move employment, especially if they don't like something about their current position (Csiszárík-Kocsír & Garia-Fodor, 2018). According to a 2021 CareerBuilder survey, Gen Z service length is significantly less than previous generations. Gen Z employees work for an average of 2 years and 3 months. It is shorter than the cohort of the previous generation's workforce. Several studies have discovered a specific phenomenon concerning Gen Z, which is that this generation has a higher turnover rate and lower stickiness to their jobs. According to LinkedIn 2022 data, Gen Z shows a greater willingness to job hop. Members of Gen Z switch jobs at a rate of 134%, which is higher than in 2019, and 25% intend to leave their current employers within the next six months. In line with these findings, Deloitte, June 2022, reported that less than half of Chinese Gen Z expect to leave their jobs within the next two years, a 30% decrease from the previous year. However, half of them would leave their jobs if they did not have another job lined up.

The Indonesia Manpower Minister made the same observation in Indonesia context, which is consistent with previous studies. If properly utilized, the large Gen Z workforce allows for the potential advancement of the Indonesian economy. Furthermore, this digital native generation, which is now between the ages of 10 and 25, has a different working pattern than the previous generation. Gen Z has no long-term commitment and only works as long as it makes them happy. The presence of Gen Z will increase labor turnover or the intensity with which a company deals with employee turnover. The pattern of working relationships will also change, with an increase in part-time work systems, freelancers, and partnerships. (Fauziyah, 2022).

This generation is content with not having only one way to express itself. As a result, it is critical to define the type of leadership that can improve their service length as well as their engagement with the company. Regarding the aforementioned Gen Z phenomenon, more research is needed to investigate the leadership style as well as any type of organizational support required to improve turnover and workplace engagement from the perspective of Generation Z.

2. RESEARCH GAP

In the context of the Indonesian workplace, we need further study concerning Gen Z and how leadership style and organizational support impact turnover intention amongst this generation. The perception of authentic leadership affects work-related attitudes and happiness (Jensen & Luthans, 2006). An authentic leadership style, trust in the leader, and job overload may impact employee flourishing. And with that as the outcome, authentic leadership is fostering a trustful relationship between employees and their leaders. It might result in the increased flourishing of

employees, and deeper leader–follower relationships including heightened levels of trust, job engagement, workplace well-being, and sustainable performance (Kleynhans, et al., 2022).

Another dimension that impacts turnover intention also comes from organizational support. In China, the study of frontline employees who are generally under great pressure, fragile to burnout, and have high turnover, has proven to perceive organizational support has a significant negative impact on burnout and turnover intention (Wang & Wang, 2020).

However, there is limited information and research on the effects of authentic leadership, as a specific leadership style, and also perceive organizational support on the turnover intention specific to the youngest workforces' cohort, Gen Z. These two variables (authentic leadership and perceived organizational support) are likewise unexplored among Gen Z in the Indonesia context. Thus, the present study aims to address the gap in the literature on the importance of authentic leadership in reducing employee turnover intention also beneficial to come up with an undertaking that gauges perceived organizational support among Generation Z in Indonesia.

3. RESEARCH QUESTION

Based on the background information and the problem stated above, this study would like to answer the following questions:

- 1) How does Authentic Leadership affect the Turnover Intention of Gen Z?
- 2) How does the Perceived Organization Support affect the Turnover Intention of Gen Z?
- 3) How does the Authentic Leadership style affect the Perceived Organization Support of Gen Z?
- 4) How does Perceived Organization Support mediate the effect of the Authentic Leadership style toward Turnover Intention?

4. LITERATURE REVIEW

4.1. Authentic Leadership (AL)

Authenticity is derived from ancient Greek philosophy: "Be true to thine own self." For the last three decades, AL has been a key component in positive leadership research, as well as a theoretical extension as a "root construct in leadership theory." (George, 2003). Authentic leaders are aware of their own and others' strengths and flaws, as well as how they think and act. They are confident in their abilities, have faith in the future, and are upbeat, resilient, moral, and ethical. They are genuine and help to develop their colleagues into leaders (Ilies, et al., 2005). AL is defined as "a pattern of leader behavior that draws on and promotes positive psychological capacities as well as a positive ethical climate to foster greater self-awareness, an internalized moral perspective, balanced information processing, and relational transparency on the part of leaders working with followers, fostering positive self-development" (Walumbwa, et al., 2008)

4.2. Turnover Intention (TI)

Turnover Intention (TI) is the likelihood of employees leaving their current job, whether voluntarily or involuntarily. Employees may consider and plan to leave their organization for a variety of reasons (Belete, 2018). Employees' willingness or attempts to leave their current workplace voluntarily have been defined as turnover intention (Takase, 2010). TI is divided into four categories: (1) functional, which is related to job performance; (2) avoidable, which is caused by lower pay and poor working conditions; (3) unavoidable, which is due to reasons

such as family moves, serious illnesses, and death; and (4) involuntary turnover, which is due to management's discretion to force the employee to leave (Belete, 2018) (Taylor, 1998). It is related to "change readiness," in which employees adapt to changing internal and external market demands, leading them to move to a different company or organization (Schyns, et al., 2007), supporting the views of the unfolding theory of turnover intention. TI has been linked to several negative outcomes for employers and employees alike (Hancock, et al., 2013). Because it is a useful proxy for actual turnover, TI is the best predictor of actual turnover (Griffeth, Hom, & Gaertner, 2000). Employee retention and turnover rates, which are among the top concerns for most businesses, are affected by a variety of factors (Cohen, et al., 2016)

7.3. Perceived Organizational Support (POS)

According to organizational support theory, POS fosters a sense of duty to repay the organization with increased efforts, including the expectation of rewards and satisfying socioemotional needs for approval, esteem, affiliation, and emotional support. There is confidence that assistance will be provided for improved job performance. Support from the organization improves employees' subjective well-being in terms of mood, contentment, self-esteem, and stress reduction and encourages people to have a positive outlook on their jobs and organization. The benefits of POS include improved job performance, innovation, creativity, adoption of technology, and customer service. (Stinglhamber & Eisenberger, 2011). employees who receive positive treatment—particularly supervisor support, organizational rewards, and favorable working conditions—may experience positive outcomes such as job satisfaction, affective commitment, performance well-being, and a decrease in withdrawal behaviors such as absenteeism and turnover (Rhoades, et al., 2001).

7.4. Hypothesis Development

7.4.1. The effect of Authentic Leadership (AL) on Turnover Intention (TI)

The effects of AL on TI on organizations have been examined in several research. For instance, (Amunkete & Rothmann, 2015) discovered that when leaders are seen as genuine, nurses are less likely to experience later workplace bullying, burnout, and intention to leave their job or profession. According to a Malaysian study, self-awareness and balanced information processing have a significant impact on work engagement, which in turn has a significant impact on TI (Ahmad & Chin, 2018). (Azanza, et al., 2015) evaluated the effect of AL on TI using data acquired from Spanish employees. The results showed that AL and TI had a negative relationship. of graduates to work was considered low (Sasmito, Panji, Kustono, & Patmanthara, 2015).

The negative relationship between AL and TI, was also supported by a recent study conducted in the Philippines. It was established through the study that AL is important because of its detrimental impact on employee TI. This explains why employees' intentions to change jobs or leave their existing employer or organization are reduced because of AL's expanding influence and effects (Ladao, et al., 2022). Therefore, the following hypotheses can be proposed:

H1: Authentic leadership negatively affects turnover intentions.

7.4.2. The effect of Authentic Leadership (AL) on Perceived Organizational Support (POS)

AL significantly affects POS among employees. With the positive relationship between AL and POS, employees recognize that when leadership is authentic, their perceived support from the organization increases (Ladao, et al., 2022). When AL improves employee morale and fosters good working relationships, it forms the notion of organizational support. Hence, greater

work engagement and the satisfaction of socioemotional demands are brought about by employees' perceptions of favorable organizational support (Shore & Shore, 1995). Furthermore, (Yijia & Jinhong, 2016) discovered that AL significantly promotes POS among nurses using regression analysis. Thus, the following hypotheses can be proposed:

H2: Authentic leadership positively affects perceived organizational support.

7.4.3. The effect of Perceived Organization Support (POS) on Turnover Intention (TI)

Several researchers also investigated the organizational effects of POS on TI. According to organizational support theory, giving employees a good environment can have positive effects like a decline in attrition (Eisenberger, et al., 2016). The findings showed that POS and TI are negatively correlated with one another in both parameters. (Ladao, et al., 2022). POS has a negative impact on burnout and turnover among gas station frontline employees (Wang & Wang, 2020). A study in Malaysia showed that employees who receive high levels of organizational support are less likely to leave the organization (Lew, 2009). Moreover, (Takaya & Ramli, 2020) discovered that POS is significantly and negatively related to TI. Thus, in this study, the following hypotheses can be proposed:

H3: Perceived organizational support affects turnover intentions.

7.4.4. The Mediating Effect of Perceived Organizational Support (POS) on the relationship between Authentic Leadership (AL) and Turnover Intention (TI)

Several researchers have examined other factors that influence the link between AL and TI. The effect of POS as a mediator between AL and TIs was significant. As the findings showed a medium effect size, the mediation reflected a heightened negative relationship between AL and employees' TIs. This explains why, with POS, AL reduces the likelihood of employees quitting their jobs or moving on to another company or organization (Ladao, et al., 2022). Another study discovered that POS mediates the impact of HR practices on organizational commitment and job satisfaction, as well as its negative association with TI, using structural equation modeling on samples from store salespeople and insurance agents (Allen, et al., 2003).

A recent study indicates that AL is positively related to POS, with a large effect size, and negatively related to TIs, with a small effect size. Thus, POS clearly and significantly aids AL in retaining employees within the company or organization and reduces their intentions to leave or change jobs (Ladao, et al., 2022). Hence, in this study, the following hypotheses can be proposed:

H4: Perceived organizational support has mediating effects between authentic leadership and Turnover intentions.

7.5. Research Framework

The research framework demonstrates the three constructs and their potential correlations based on the thorough literature review and hypotheses put forth. Figure 2.1 presents the direct effect of AL and its subcomponents on TI and the mediating effect of POS on the relationship between AL and TI.

The following is hypothesized based on the literature review:

H1: Authentic Leadership negatively affects Turnover Intention on Gen Z

H2: Authentic Leadership positively affects Perceived Organizational Support on Gen Z

H3: Perceived organizational support affects turnover intentions on Gen Z

H4: Perceived Organizational Support has mediating affects between Authentic Leadership and Turnover Intentions on Gen Z

8. RESEARCH METHODS

This scientific work uses a descriptive quantitative approach by conducting exploratory approaches in the ongoing research environment. This scientific work is also equipped with a single cross-sectional analysis. This study is being conducted in Indonesia to investigate the factors influencing turnover intention from authentic leadership as well as perceived organizational support among Gen Z.

First, the author will define the type of research, followed by a discussion of data sources and how to collect it. Following that, the author will define the population and sampling method by defining a group that will be studied. Considering the literature review, the author will decide how to measure the variables with dimensions and measurement items. The questionnaire will then be designed by the operational variables. A pilot test will be conducted before the questionnaire is distributed to ensure its reliability and validity. Finally, data analysis techniques such as respondent profiles, descriptive statistics, PLS-SEM analysis, and hypothesis testing will be discussed.

This method enables a researcher to select population elements into a sample based on the researcher's purpose, with the expectation that the selected elements will effectively represent the study's population (Malhotra, 2010). The purpose of this study has been elaborated on, which is to examine the impact of Authentic Leadership Style and Perceived Organization Support on Turnover Intention among Gen Z. Therefore, research will be conducted among a particular worker group, Gen Z, using the following:

1) Sample criteria:

- The population is Gen Z workers, defined as those born between 1995 and 2016.
- Minimum 3 months working in the current position.
- Working in greater Jakarta. Jakarta, as the nation's capital city, represents the dynamic of human resources across industries and multicultural backgrounds.

2) Sample size:

The sample size is one factor in study design that researchers must consider when planning a study. The reasons for accurately calculating the required sample size are to achieve statistically significant results and to ensure that research resources are used efficiently (Burmeister & Aitken, 2012). There are various ways for identifying a sample size, this study determines the sample size using Cohen Table (Table 3.2). As shown in Table 3.2 below, this study employs a 5% significance level and a minimum R² of 0.25 percent, with 4 (four) arrows pointing at the construct. The sample size for this way is determined at 65.

3) Questionnaire Design

The questionnaire will be distributed via WhatsApp to targeted respondents which are Gen Z employees in Greater Jakarta. The set of questionnaires consists of two parts, section A and section B.

- Section A: contains questions regarding the demographic profile of the respondents (gender, age, profession).
- Section B: contains questions related to descriptive analysis using the operational variables of this study.

The format used in the questionnaire is closed-ended questions; using the Likert scale in the form of interval scales is commonly used to measure a person's intentions, attitudes, opinions, or perceptions about social phenomena. Therefore, there are a total of 26 measurement items with 9 dimensions to reflect the variables and the following is an explanation of the operational variables in this study such below:

Table. Operationalization of Variables

Variable	Dimension	Code	Measurement item	Source
Authentic Leadership (AL)	Leader self-awareness (AL1)	AL1.1	My leader seeks feedback to improve interactions with others.	(Walumbwa, et al., 2008)
		AL1.2	My leader demonstrates beliefs that are consistent with actions.	
		AL1.3	My leader encourages everyone to speak their mind.	
		AL1.4	My leader analyses relevant data before coming to a decision.	
	Internalized moral perspective (AL2)	AL2.1	My leader accurately describes how others view his or her capabilities.	
		AL2.3	My leader makes decisions based on his or her core beliefs.	
		AL2.3	My leader tells you the hard truth.	
		AL2.4	My leader makes difficult decisions based on high standards of ethical conduct.	
Balanced processing	AL3.1	My leader says exactly what he or she means.		

	(AL3)	AL3.2	My leader solicits views that challenge his or her deeply held positions.
		AL3.3	My leader displays emotions exactly in line with my feelings.
		AL3.4	My leader knows when it is time to re-evaluate his or her position on important issues.
	Relational transparency (AL4)	AL4.1	My leader admits mistakes when they are made.
		AL4.2	My leader listens carefully to different points of view before coming to conclusions.
		AL4.3	My leader asks me to take positions that support my core values.
		AL4.4	My leader shows he or she understands how specific actions impact others.

Variable	Dimension	Code	Measurement item	Source
Perceived Organizational Support (POS)	Value recognition (POS1)	POS1.1	I feel valued and rewarded when I perform 'above and beyond' my stated job duties	(Eisenberger, et al., 1986) (Rhoades & Eisenberger, 2002)
		POS1.2	This company has a culture of recognition for excellent performance	
		POS1.3	This company provides fair compensation and benefits in return for my contribution to the company	
	Job support (POS2)	POS2.1	When I first started working here, this company provided the necessary onboarding information and training	
		POS2.2	This company has a culture that allows me to develop my professional skills	
		POS2.3	This company provides me with the tools I need to help me grow and navigate my career	
	Care about interests (POS3)	POS3.1	It is easy to find out another career opportunity that is available for me at this company	
		POS3.2	Diversity is valued at this company	
		POS3.3	The benefit I received at this company meet my needs.	
Turnover Intention (TI)	Likelihood of quitting the current job (TI1)	TI1.1	Are you considering quitting your current job?	(Michaels & Spector, 1982) (Li & Li, 2000)
		TI1.2	Do you want to find other jobs of the same nature?	
		TI1.3	Do you want to find other jobs of different nature?	
	Likelihood of obtaining an outside job (TI2)	TI2.1	Given your current situation and conditions, how likely do you think you are to find a suitable position in another organization?	
		TI2.2	If you know there is a suitable job vacancy for you in another organization now, how likely are you to get the job?	
		TI2.3	Will you quit your current job?

9. FINDINGS, ANALYSIS, AND DISCUSSION

6.1. Pilot Study

The pilot test, which took place from March 23rd to March 25th, 2023, received 58 responses out of a target of 30. As a result, the researcher utilized the study's validity based on the number of respondents (N=58, Alpha = 95%, and r-table 0,2542). Based on the questionnaire feedback received, data showed that the value in both the validity and reliability test achieved a minimum number of the requirement which was above 0.3 for Pearson's Correlation and above 0.7 for Cronbach's alpha (Sekaran & Bougie, 2010). Therefore, the pilot study indicated that the findings of the validity and reliability of the two-tailed test were reliable.

6.2. Respondents Profile

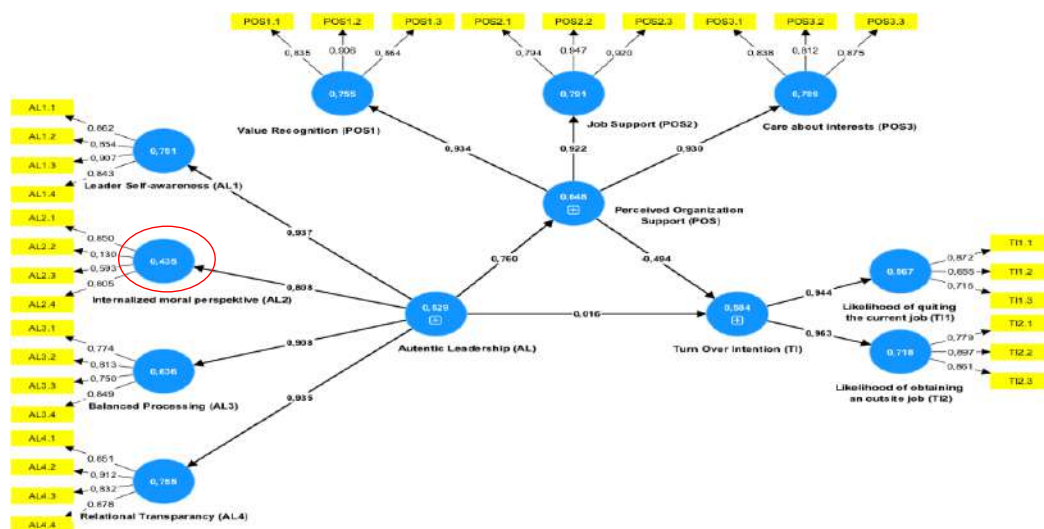

This study focuses on the youngest workforce, Generation Z (born between 1995 and 2016) from Greater Jakarta (Jabodetabek area) who have worked for at least three months as desired purposive sampling criteria. The questionnaires were distributed over 10 days to Gen Z in Greater Jakarta via the WhatsApp application. the researcher discarded several samples that did not meet the criteria. Due to outlier exclusion, the total data is 109 to proceed.

6.3. Descriptive Statistics

Descriptive analysis is to describe and summarize the data set's main characteristics and variables from the respondents' perspective. For all variables, the independent variable is Authentic Leadership (AL), while the dependent variables are Turnover Intention (TI), and Perceived Organization Support (POS) as the mediating role. All variables were measured on 5-point Likert scales. The result shows that no 'N' is missing because each indicator has 109 responses. And The received data of responses in Table 4.4 shows that all values are less than 0, indicating that the distribution of variables is negatively skewed toward the right tail. As none of the skewness values is larger than 1 means the data is considered normal (Hair et al. 2010).

6.4. Measurement Model Evaluation

The researcher examined the outer model of each indicator and dimension in this study. The author used PLS-SEM software to test the outer loading factor for each indicator and then analyzed it using the Heir algorithm.

Initial Research Model with Average Variance Extracted (AVE)

Source: PLS-SEM Report by Author, 2023

The first evaluation criteria are summarized in above Figure ‘*Initial Research Model with Average Variance Extracted (AVE)*’, which shows the value of the outer loading factor for all 9 reflective dimensions as a constructs measure of 3 variables: Authentic Leadership (AL), Perceived Organizational Support (POS), and Turnover Intention (TI). If the value of the outer loading factor is greater than 0.70, it is considered to be high consistency and valid (Ulum et al., 2008). The findings indicate that the majority of the requirements have been met and supported by outer loading factors more than 0.70, reflecting indicators, and variables that demonstrate the model's internal consistency. The indicator of Internalized moral perspective (AL2), which has an outer loading factor of 0.653, stands out from the rest of the indicators with outer loading values higher than 0.70. Given the other evaluation criteria and the indication's low outer loading factor value, this indicator was likely invalid.

Following the evaluation of the outer loading factor criteria, the second criterion to be assessed is the internal consistency or reliability using a measurement composite reliability and/or Cronbach's alpha coefficient tests (Hair et al., 2014). Cronbach's alpha has a range of 0 to 1, and it is widely accepted that a value of 0.70 or higher is acceptable (Kamis et al., 2020). Cronbach's alpha values were greater than 0.70 indicating that the model has internal consistency.

The initial research model constructs validity and reliability reflected in all three dimensions, including each reflective indicator, as follows:

Table. Construct Validity and Reliability (1st Version)

Variable	Dimension	Cronbach's alpha (valid >0.7)	Composite reliability (rho_a) (valid >0.7)	Composite reliability (rho_c) (valid >0.6)	Average variance extracted (AVE) (valid >0.5)
Authentic Leadership (AL)	AL	0.930	0.949	0.942	0.529
	AL1	0.889	0.893	0.923	0.751
	AL2	0.575	0.673	0.715	0.435
	AL3	0.809	0.818	0.875	0.636
	AL4	0.891	0.893	0.925	0.755
Perceived Organizational Support (POS)	POS	0.931	0.934	0.943	0.648
	POS1	0.837	0.843	0.902	0.755
	POS2	0.865	0.878	0.919	0.791
	POS3	0.794	0.799	0.879	0.709
Turnover Intention (TI)	TI	0.853	0.872	0.892	0.584
	TI1	0.609	0.637	0.795	0.567
	TI2	0.803	0.817	0.884	0.718

Source: PSL-SEM Report by Author, 2023

Nine reflective dimensions have been examined to support the variables by research models. According to (Hair et al., 2014), the acceptable value of composite reliability and/or Cronbach's alpha coefficient is higher than 0.70. According to Table ‘*Construct Validity and Reliability (1st Version)*’ above, there are two dimensions with composite reliability and/or Cronbach's alpha coefficient below 0.70. They are associated with Internalized moral perspective (AL2) and the Likelihood of quitting the current job (TI1). AL2 has 0.575

Cronbach’s alpha and 0.673 Composite reliability (ρ_a) while TI1 showed a low value of 0.609 Cronbach’s alpha and 0.637 Composite reliability (ρ_a). Therefore, based on data in this study AL2 appears to be unimportant in the context of the GenZ population in Indonesia. Therefore, this dimension was ignored.

Consistent with the decision to eliminate AL2 based on three evaluation criteria —from the outer loading factor to the convergent validity assessment—the decision to remove AL2 from the research model will not change the model since the variable of Authentic Leadership (AL) still has three reflective dimensions. However, removing indicators from measurement models involves some additional considerations as explained by (Hair et al., 2017). Meanwhile, different conditions with Turnover Intention (TI) with only two reflective dimensions; if the researcher eliminated TI1, only one reflective dimension would remain which would not be possible to have only one dimension. Furthermore, the AVE value of TI1 is 0.567 which is still higher than 0.5 as a prerequisite. As a result, the researcher decided to change TI as the first order by removing the TI1 and TI2 as dimensions instead. As a result, the researcher depicted the updated model following the reconstruction of the research model for further process.

The reliability and validity construction values must be recalculated after the initial research model was reorganized. The AL2 dimension will no longer be included in the model, the researcher has concluded. Similar methods were used for the TI1 and TI2 dimensions, however for the TI dimension, the researcher elected to eliminate both TI1 and TI2 and replace them with indicators at the first level and TI as a dimension. Following figure is the result of those modifications to the second-order version.

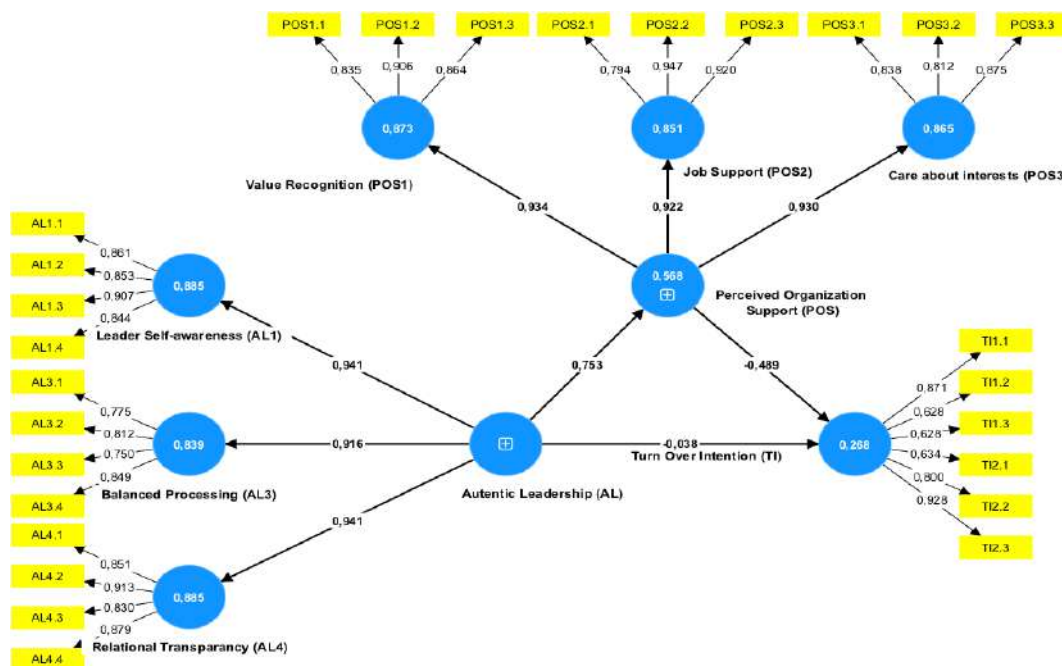

Figure. Second Order Modification Research Model (2nd Version)

Source: Source: PLS-SEM Report by Author (2023)

6.5.Hypothesis Testing

SmartPLS3 was utilized to evaluate the significance of the path coefficients and test the hypothesized correlations. By calculating empirical T values that are significant at a given probability of error if they are larger than the critical value (T distribution values), the bootstrapping method determines the significance of path coefficients (Hair et al., 2014). This study used the following critical values for one-tailed tests in which the T-value is 1.65, and the P-value 0.05 (significance level= 5%). As an initial study, the following direct hypothesized relationships were tested:

- H1: Authentic Leadership negatively affects Turnover Intention
- H2: Authentic Leadership positively affects Perceived Organizational Support
- H3: Perceived Organizational Support affects Turnover Intentions.
- H4: Perceived Organizational Support has mediating effects between Authentic Leadership and Turnover Intentions

The above hypothesis was tested using the bootstrapping test, and to summarize the findings:

Table. Hypothesis Testing Result

Ha	Relationship	Original sample (O)	Sample mean (M)	Standard deviation	T statistics	P values	Confident interval		Result
							5.0%	95.0%	
Direct Effect									
H1	AL ► TI	-0.044	-0.046	0.181	0.241	0.405	-0.344	0.259	Rejected
H2	AL ► POS	0.752	0.751	0.055	13.694	0.000	0.653	0.831	Accepted
H3	POS ► TI	-0.485	-0.495	0.158	3.078	0.001	-0.749	-0.227	Accepted
Indirect Effect									
H4	AL ► POS ► TI	-0.365	-0.372	0.125	2.920	0.002	-0.581	-0.170	Accepted

7. CONCLUSION AND RECOMMENDATION

The strategic goal of this research is to examine the effect of Authentic Leadership Style and Perceived Organization Support as a mediating effect on Turnover Intention among Gen Z. Gen Z as the object and respondents of the study, the disseminated questionnaire received 116 respondents through the online survey conducted in the Jabodetabek area, using non-probability purposive sampling. After exclusion criteria of the study, some of the respondents who completed the questionnaire did not meet the criteria and the data were discarded. Hence the overall data is 109 respondents to continue because the outliers were excluded.

From the strategic objectives of the study, the researcher developed four hypotheses. The primary goal of this study is to analyze and examine the effect of Authentic Leadership (AL) on Turnover Intention (TI) amongst Gen Z. And it is expected that Authentic Leadership (AL) negatively affects Turnover Intentions (TI). The findings indicated that there was no significant effect of Authentic Leadership (AL) on Turnover Intention (TI) among Gen Z therefore, it was discovered that the hypothesis was rejected. The respondents did not believe that the Authentic Leadership (AL) trait alone was significant in lowering Turnover Intention (TI).

The second goal of this study is to analyze Authentic Leadership (AL) positively affects Perceived Organizational Support (POS). The findings indicated that the hypothesis is accepted.

It was demonstrated that Authentic Leadership (AL) had a significant and positive effect on Perceived Organizational Support (POS). A positive and solid relationship between Gen Z and the leader cultivates and establishes a positive working environment. Gen Z values organizations and leaders who treat them with respect, equity, and inclusion, which were revealed in the Authentic Leadership (AL). When it comes to Authentic Leadership (AL) styles, Generation Z will have more freedom of expression and an openness to understanding diverse types of individuals.

The third goal is to analyze the effect Perceived Organizational Support (POS) affects Turnover Intentions (TI). The finding confirmed that the hypothesis is accepted. Perceived Organizational Support (POS) has a considerable beneficial effect on job satisfaction and organizational commitment, resulting in a lower Turnover Intention (TI). The value recognition, job support and care about interest have a positive effect on the duties they perform on a regular basis. Recognition will continue to foster positive motivation to work, and job support may assist employees in managing and performing their jobs. Lastly, care about interest also demonstrates the organization's support for employee for the future career and personal development.

The fourth goal is to investigate the Perceived Organizational Support (POS) has mediating effects between Authentic Leadership (AL) and Turnover Intentions (TI). The study revealed that the hypothesis is accepted that Perceived Organizational Support (POS) has a full mediating effect. The results discovered there is a strong negative relationship of Authentic Leadership (AL) toward Turnover Intention (TI) with Perceived Organizational Support (POS) as mediating factor.

In conclusion, the researchers discovered that Authentic Leadership (AL) has no impact if it operates independently, on the other hand it turns to be significant when it is accompanied by positive Perceived Organizational Support (POS). As a result of the entire mediation effect, Perceived Organizational Support (POS) is a crucial and important element between Authentic Leadership (AL) and reduction of Turnover Intention (TI) among Gen Z.

ABSTRACT

COVID-19 pandemic in Indonesia has presented health challenges that have created potential opportunities for pharmaceutical companies due to increased reliance on medicines and medical devices. Indonesia's pharmaceutical market has experienced rapid growth in the Southeast Asia region, driven by the country's large population of over 265 million people and the implementation of the Indonesia's Universal Healthcare Program (JKN) in 2014. This study aims to evaluate the financial health of two pharmaceutical companies, PT Kimia Farma Tbk (KAEF) and PT Indofarma Tbk (INAF), listed on the Indonesia Stock Exchange.

This study analyzes data from the period of 2018 to 2022, collected from the official company websites. Various financial ratios, including profitability ratios, solvency ratios, liquidity ratios, and activity ratios, were investigated. The results indicate a significant decline in the financial health of both PT Kimia Farma Tbk and PT Indofarma Tbk over the research period. Kimia Farma Tbk's financial health deteriorated from level A (Healthy) in 2018 to level BB (Unwell) in 2022, while Indofarma Tbk experienced a decline from level A (Healthy) in 2018 to level B (Unwell) in 2022.

This study highlights the potential opportunities within the pharmaceutical industry during the COVID-19 pandemic. However, it also reveals the negative impact faced by PT Kimia Farma Tbk and PT Indofarma Tbk, resulting in a decline in their financial health. Therefore, it is crucial for both companies to implement stringent monitoring and evaluation measures, as stipulated by the Decree of the Ministry of State-Owned Enterprises, to address their financial challenges effectively.

Keywords: Financial Performance, Financial Ratios, Pharmaceutical Companies

INTRODUCTION

On January 30, 2020, the World Health Organization (WHO) declared 2019-nCoV to be a Public Health Emergency of International Concern (PHEIC), due to the significant increase in confirmed new cases in various countries. The government policies which have been announced to the public include the formation of a special COVID-19 taskforce; instructions on how to use face masks; physical and social distancing rules; an announcement to encourage research and innovation related to fighting against the COVID-19 pandemic. Pandemic has opened our eyes to the importance of medicines, medical devices and healthcare workers. Due to the increasing demand over the pandemic, besides Indonesia is home to more than 265 million people (BPS, 2020), the Government committed to reforming and has included the medical device and pharmaceutical sectors as part of the priority sector in an effort to realize the Making Indonesia 4.0 program. The President also said at the annual plenary meeting of Indonesia's Consultative Assembly, that fundamental reforms in the health sector must be accelerated (Kemenpora, 2021).

In the midst of the substantial economic decline triggered by the COVID-19 outbreak, the chemical, pharmaceutical, and traditional medicine sectors still managed to grow 8.65% in the second quarter 2020, and 5.59% throughout the first half of the year (AHK Indonesia, 2020). Government spending for the healthcare budget continues to rise with 18.3% growth (CAGR 2016-2021), indicating the higher demand for healthcare services and products, which will benefit pharmaceutical, hospital, clinical lab and medical player. One of them is Indonesia's Universal Healthcare Program (JKN) rollout which covers up to 82.3% Indonesian population in Mar-2021.

BUMN or State Owned Enterprise (SOE) have participated in paying special attention to the pharmaceutical sector since the 2020 pandemic by establishing a pharmaceutical holding with the parent holding Bio Farma and consisting of PT Kimia Farma Tbk. (KAEF) and PT Indofarma Tbk (INAF). The establishment of the pharmaceutical holding has been stated in PP or Government Regulation Number 76 of 2019 concerning the addition of the Republic of Indonesia State Equity Participation into PT Bio Farma's Share Capital which was issued on October 15, 2019 and Decree of the Minister of Finance or Keputusan Menteri Keuangan (KMK) Number 862/KMK. 06 / 2019 regarding Stock Inbreng.

Figure 1. KAEF and INAF under parent holding Bio Farma

One of the measurements that can be used to analyze the company performance is through the financial reports. This study aims to measure the financial performance of PT Kimia Farma Tbk (KAEF) and PT Indofarma Tbk (INAF) by analyzing the annual financial analysis report from 2018 to year 2022. There are several financial ratios that can be utilized as the measurement of financial performance. The ratios that were used are Profitability Ratio, Liquidity Ratio, Activity Ratio, Solvency Ratio.

1. LITERATURE REVIEW

1.1. Pharmaceuticals Industry in Indonesia

The pharmaceutical industry is an industry that is very vital for the survival of people in a country. The chemical, pharmaceutical and traditional medicine industries have actually accelerated during the Covid-19 pandemic. Demand for medicines, especially vaccines and traditional medicines to maintain body health, has increased during the pandemic, making this industry reach its highest level in the last 9 years.

Figure 1. Value and GDP Growth of Chemical, Pharmaceutical and Traditional Medicine Industries 2010-2021 (Kusnandar, March 29, 2022)

The Central Statistics Agency (BPS) reports that the domestic product (GDP) of the chemical, pharmaceutical and traditional medicine sub-sector at current prices (ADHB) will reach IDR 339.18 trillion in 2021. This value accounts for 11.51% of the GDP of the national non-oil and gas processing industry which reached IDR 2.95 quadrillion. If measured by GDP at constant prices (ADHK) in 2010, the chemical, pharmaceutical and traditional medicine industries grew 9.61% to Rp233.87 trillion in 2021 compared to 2020. The sector's growth was the highest since 2013. The improvement in this achievement was in line with public consumption spending on health and education which also grew 1.7% 2021 (Kusnandar, March 29, 2022). Indonesia is also one of the fastest-growing pharmaceutical markets in Asia

6th International CEO Communication, Economics, Organization & Social Sciences Congress

with pharmaceutical market size was \$8.6 billion in 2021 and the medical devices market size was \$3.6 billion in 2021 (Global Data, September 5, 2022), this makes Indonesia the largest pharmaceutical market in the ASEAN region.

According to data from the Ministry of Health, until 2021, there are 241 pharmaceutical manufacturing industries, 17 pharmaceutical raw material industries, 132 traditional medicine industries, and 18 natural product extraction industries. The growth of medical equipment production facilities also continues to increase. From 2015 to 2021, the number of companies producing medical devices increased from 193 to 891 companies. Indonesia also exports pharmaceutical products and medical devices to several countries, namely the Netherlands, England, Poland, Nigeria, Cambodia, Vietnam, Philippines, Myanmar, Singapore, South Korea, and the United States (OSS Ministry of Investment, February 6, 2022).

In 2020, Ministry of State Owned Enterprise (SOE) forming a pharmaceutical holding with the parent holding Bio Farma and consisting of PT Kimia Farma Tbk (KAEF) and PT Indofarma Tbk (INAF) as members. The purpose of establishing this pharmaceutical holding is to strengthen the independence of the national pharmaceutical industry, reduce imports of pharmaceutical raw materials, increase product availability, by creating joint innovation in the supply of pharmaceutical products.

PT Kimia Farma Tbk is the first pharmaceutical industry company in Indonesia which was founded in October 16, 1817, the Government of the Republic of Indonesia merged a number of pharmaceutical companies to become PNF (State Pharmaceutical Company) Bhinneka Kimia Farma. Then on August 16, 1971, the legal entity form of PNF was changed to a Limited Liability Company, so the company name changed to PT Kimia Farma (Persero). On July 4, 2001, PT Kimia Farma (Persero) again changed its status to a public company, PT Kimia Farma (Persero) Tbk and changed to PT Kimia Farma Tbk, as of February 28, 2020 until now. Kimia Farma Tbk is engaged in various aspects of the pharmaceutical business, including the production, distribution and retailing of pharmaceutical products. The company operates in multiple segments, including ethical drugs, over-the-counter drugs, consumer health products, and healthcare services.

PT Indofarma Tbk is a pharmaceutical company established in August 6, 1918, that got the first initial public offering at Indonesia Stock Exchange (BEI) in 2001. The company operates in various segments, such as ethical drugs, generic drugs, consumer health products, and medical devices.

2. Previous Research

Financial ratio analysis (FRA) is a good evaluation method to measure company performance (Megaladevi, 2015) and believed to be utilized to predict company in the future. According to (Ross et al., 2010) the financial ratio was a calculation that used variables commonly found on financial statements to assess and measure the performance of each department and managers of multi-level companies, evaluating competitive of rivals, and for projecting the future through supplying historical financial information to get potential investors. FRA is based on an accountable analysis of information, especially on the balance sheet, income

statement, cash flow statement and statement of financial position (Cubaque-zorro et al., 2014). This method is usually employed by companies to compare their performances against competitors. A number of empirical studies on the financial ratio of different industries can be found and studied (Tarawneh, 2006). Daryanto, W.M & Samidi, S (2018) conducted the study of financial health condition for SOEs of Energy and Mineral Resources.

There are several studies that have discussed the use of financial ratio analysis to see the financial performance of companies in the palm oil industry. In research (Kurniati, Rudianti, & Nugroho, 2022) which also uses PT. Kimia Farma Tbk. and PT. Indofarma Tbk companies as a sample, it shows that PT. Kimia Farma Tbk has a better financial performance than PT. Indofarma Tbk on Q1 2020 and Q2 2020. Another study conducted on the effects of financial ratios on pharmaceuticals companies such as (Daryanto & Daryanto, 2019) which two are pharmaceutical SOEs and two others are private companies, and the result shows that the four companies have achieved financial health condition levels based on the SOE Decree, with rank ratings during 2010-2017 : 1). Kimia; all AA levels; 2). Bio; AAA for the first three years; and AA for the last five years; 3). Kalbe; AAA for the first six years; and AA for the last two years; and 4). Darya; all AA levels. Both SOEs and private companies were successful in managing their business. Other studies such as (Annisa & Hirawati, 2022), which compared financial performance in PT Kimia Farma Tbk and PT Kalbe Farma Tbk in 2018-2021, showed that the financial performance record of PT Kalbe Farma Tbk was better than that of PT Kimia Farma Tbk in terms of liquidity ratios, solvency ratios and profitability ratios. Meanwhile, based on the market value ratio, the financial performance of PT Kimia Farma Tbk is better than that of PT Kalbe Farma Tbk.

3. The Decree of Ministry of State-owned Enterprises

The definition of SOE, according to Indonesian Law No. 19/2003, is an entity whose entire or most of its capital is owned by the state through direct participation originating from separated state assets. Article 1 Paragraph 2 states that a limited liability company is a state-owned company in the form of a limited liability company whose capital is divided into shares of which the Republic of Indonesia owns all or at least 51% of the shares intending to pursue profit. The decree of the Ministry of State-owned Enterprises No. KEP-100/MBU/2002 provides a regulatory framework to measure financial health based on financial ratios. Besides, the growth of business should be supported by good infrastructure and an evaluation system to measure the efficiency and level of competition among SOEs. This financial evaluation applies to all SOEs in the financial and non-financial industry. From the financial aspect, total weight score for infrastructure is 50 and non-infrastructure is 70, which consist of the calculation is eight financial ratios: return on equity (ROE), return on investment (ROI), cash ratio, current ratio (CR), collection period (CP), inventory turnover (ITO), total asset turnover (TATO), total equity to the total asset (TETA). Figure 2 is the indicators that are assessed and each weighted on the financial aspect for the non-infrastructure industry.

4. Research Method

To accomplish this study, descriptive financial ratio analysis based on the Decree of the Ministry of SOE No. KEP-100/MUBU/2002 is used to measure, describe and analyze the financial performance of two pharmaceutical companies in Indonesia which is listed on the IDX, and are state-owned companies, namely PT Kimia Farma Tbk and PT Indofarma Tbk, which refer to information on the 2018-2021 annual financial reports. The data used was collected from the company's official website using the period 2018 – 2022. The assessment concludes the financial health condition level of these companies whether in the levels of very healthy (AAA, AA, A), or healthy (BBB, BB, B), or unhealthy (CCC, CC, C).

Table 1. The Indicator of Weight Score

Indicators	Weight Score
1. ROE	20
2. ROI	15
3. Cash Ratio	5
4. Current Ratio	5
5. Collection Period	5
6. Inventory Turnover	5
7. Total Asset Turnover	5
8. Total Equity to Total Asset	10
Total Weight Score	70

Source: The decree of Ministry of SOE No. KEP 100/MBU/2002

4.1. Profitability Ratio

4.1.1. Return on Equity

Profitability Ratio is the ratio that shows the company's ability to earn their profit. Return on Equity is used to know how efficiently company can earn profit from its equity, the higher ROE obtained by the company, the better company can generate profit from the company's equity.

4.1.2. Return on Investment

$$\text{Return on Equity (ROE)} = (\text{Net Income} / \text{Total Shareholder's Equity}) \times$$

Return on Investment most is used to measure how success company can generate their profit divide to cost of investment. The effectiveness of the company in managing their investment to earn income can be measured in this ratio.

$$\text{Return on Investment} = (\text{EBIT} + \text{Depreciation} / \text{Capital Employed})$$

Table 2 shows the list of ROE and ROI Assessment Score to get the number of indicator of Decree of Ministry of SOE No.KEP 100/MB/2002.

Table 2. List ROE and ROI Assessment Score

ROI (%)	Score	ROE (%)	Score
18 < ROI	15	15 < ROE	20
15 < ROI <=18	13,5	13 < ROE <= 15	18
13 < ROI <= 15	12	11 < ROE <= 13	16
12 < ROI <=13	10,5	9,0 < ROE <= 11	14
10,5 < ROI <= 12	9	7,9 < ROE <= 9	12
9 < ROI <= 10,5	7,5	6,6 < ROE <= 7,9	10
7 < ROI <= 9	6	5,3 < ROE <= 6,6	8,5
5 < ROI <= 7	5	4,0 < ROE <= 5,3	7
3 < ROI <= 5	4	2,5 < ROE <= 4	5,5

0 < ROI <= 1	2	0 < ROE <= 1	2
ROI < 0	1	ROE < 0	0

Source: The decree of Ministry of SOE No. KEP 100/MBU/2002

4.2. Liquidity Ratio

4.2.1. Cash Ratio

Cash ratio is used to measure how can the company has an ability to pay short-term debt compare to cash that company has. If the company has the equal number of cash with the debt, shows that company has an ability to pay the debt. The more Cash Ratio of company, the better company cover the debt.

$$\text{Cash Ratio} = (\text{Cash} + \text{cash equivalents} / \text{Current Liabilities}) \times 100\%$$

4.2.2. Current Ratio

Current ratio can be used by the company to measure their ability to cover the short-term debt that refer to their current asset. The higher Current Ratio of the company, indicate the company has more ability to pay the short-term debt.

$$\text{Current Ratio} = (\text{Current Asset} / \text{Current Liabilities})$$

Table 3 shows the list of cash ratio and current ratio assessment score, the higher score of this ratio the better performance its company.

Table 3. List Cash Ratio and Current Ratio Assessment

Cash Ratio (%)	Cash Ratio (%)	Cash Ratio (%)	Cash Ratio (%)
Cash Ratio >= 35	5	125 <= Current Ratio	5
25 <= Cash Ratio < 35	4	110 <= Current Ratio < 125	4
15 <= Cash Ratio < 25	3	100 <= Current Ratio < 110	3
10 <= Cash Ratio < 15	2	95 <= Current Ratio < 100	2
5 <= Cash Ratio < 10	1	90 <= Current Ratio < 95	1
0 <= Cash Ratio < 5	0	Current Ratio < 90	0

Source: The decree of Ministry of SOE No. KEP

4.3. Activity Ratio

4.3.1. Collection Period

This ratio is used by the company to monitor how company can collect account receivable that convert to the cash. The lower of collection period of the company is better since account receivable can be collected faster by the company to get cashflow. In the table 4 shows the assessment score of Collection Period.

$$\text{Collection Period} = (\text{Average Accounts Receivables/Sales Revenue}) \times 365$$

Table 4. List Collection Period Assessment

Collection Period (CP in days)	Adjustment (days)	Score
CP <= 60	CP > 35	5
60 < CP <= 90	30 < CP <= 35	4,5
90 < CP <= 120	25 < CP <= 30	4
120 < CP <= 150	20 < CP <= 25	3,5
150 < CP <= 180	15 < CP <= 20	3
180 < CP <= 210	10 < CP <= 15	2,4
219 < CP <= 240	6 < CP <= 10	1,8
240 < CP <= 270	3 < CP <= 6	1,2
270 < CP <= 300	1 < CP <= 3	0,6
300 < CP	0 < CP <= 1	0

Source: The decree of Ministry of SOE No. KEP 100/MBU/2002

4.3.2. Inventory Turnover

Inventory Turnover is ratio that can measure the efficiency of the company in managing the inventory. The higher this ratio the better company to make the efficiency of inventory. The assessment score of Inventory Turnover has been showed in Table 5.

$$\text{Inventory Turnover} = \text{Cost of Goods Sold} / \text{Average}$$

Table 5. List Collection Period Assessment Score

Inventory Turnover (IT in days)	Adjustment (days)	Score
IT <= 60	30 < IT	5
60 < IT <= 90	30 < IT <= 35	4,5
90 < IT <= 120	25 < IT <= 30	4
120 < IT <= 150	20 < IT <= 25	3,5
150 < IT <= 180	15 < IT <= 20	3
180 < IT <= 210	10 < IT <= 15	2,4
219 < IT <= 240	6 < IT <= 10	1,8
240 < IT <= 270	3 < IT <= 6	1,2
270 < IT <= 300	1 < IT <= 3	0,6
300 < IT	0 < IT <= 1	0

Source: The decree of Ministry of SOE No. KEP 100/MBU/2002

4.3.3. Total Asset Turnover (TATO)

This ratio, Total Asset Turnover (TATO), can measure the efficiency of the company regarding the company's asset that can generate sales. In table 6 shows the list assessment of TATO score.

$$\text{TATO} = (\text{Revenue} / \text{Capital Employed}) \times 100\%$$

Table 6. List Total Asset Turnover (TATO) Assessment Score

TATO = x (%)	Adjustment (days)	Score
120 < x	20 < x	5
105 < x <= 120	15 < x <= 20	4,5
90 < x <= 105	10 < x <=15	4
75 < x <= 90	5 < x <=10	3,5
60 < x <= 75	0 < x <=5	3
40 < x <= 60	x <=0	2,5
20 < x <= 40	x < 0	2
x <= 20	x < 0	1,5

Source: The decree of Ministry of SOE No. KEP 100/MBU/2002

4.4. Solvency Ratio

4.4.1. Total Equity to Total Asset (TETA)

This ratio can measure the efficiency of company's equity toward the asset company has. The higher value of this ratio, the better company's performance. The assessment of TETA has been illustrated in table 7.

$$\text{TETA} = (\text{Total Equity} / \text{Total Asset}) \times 100\%$$

Table 7. List Total Equity to Total Asset (TETA) Assessment Score

TETA	Score
$x < 0$	0
$0 \leq x < 10$	4
$10 \leq x < 20$	6
$20 \leq x < 30$	7,25
$30 \leq x < 40$	10
$40 \leq x < 50$	9
$50 \leq x < 60$	8,5
$60 \leq x < 70$	8
$70 \leq x < 80$	7,5
$80 \leq x < 90$	7
$90 \leq x < 100$	6,5

Source: The decree of Ministry of SOE No. KEP 100/MBU/2002

5. RESULT AND DISCUSSION

5.1. Profitability Ratio

The Profitability Ratio used in this study uses two ratios, specifically the Return on Equity (ROE) and Return on Investment (ROI) ratios, in compliance with the Decree of the Ministry of State-Owned Enterprises No. KEP-100/MBU/2020. Both Kimia Farma Tbk and Indofarma Tbk witnessed a decline in their profitability growth, evident from the decreasing values of ROE and ROI from 2018 to 2022.

Figure 3. Profitability Ratios PT Kimia Farma Tbk (Author, 2023)

Figure 4. Profitability Ratios PT Indofarma Tbk (Author, 2023)

In 2018, it is illustrated in the figure 3 and 4 that Kimia Farma Tbk has a greater ROE and ROI value than in subsequent years, and also in the same year, when compared to Indofarma Tbk, Indofarma Tbk has a lower ROE of -6.6%. Over 3 years, 2019-2021, Kimia Farma Tbk's ROI growth has increased by more than 2%, although at the end of 2022, this figure has been corrected to 0.3%. Furthermore, Indofarma Tbk experienced a sharp decline at the end of the year with negative ROI and ROE ratios.

5.2 Liquidity Ratio

The Liquidity Ratio is utilized in assessing a company's ability to fulfill its short-term obligations. In this study the liquidity ratios used were Cash Ratio and Current Assets from 2018 - 2022. During this period, Kimia Farma Tbk witnessed a 19% greater decline in Current Assets compared to Indofarma Tbk.

Figure 5. Liquidity Ratio PT Kimia Farma Tbk (Author, 2023)

Figure 6. Liquidity Ratios PT Indofarma Tbk (Author, 2023)

In 2019, as shown in Figure 6, Indofarma Tbk's current ratio reached its highest value of 188%, grew by around 83% from the initial 105%, but subsequently experienced a significant

decrease to 88% by the end of the year. Conversely, the Cash Ratio at Indofarma Tbk demonstrated a noteworthy increase of more than 100% over the five-year period, reaching 34% in 2022, although there was a decrease in 2020 of around 15% from the previous year.

When comparing the current ratio in Figure 5, Kimia Farma Tbk displayed a higher current ratio than Indofarma Tbk at the end of this period, although it experienced a greater decline over the last five years. Concerning Kimia Farma Tbk's Cash Ratio, despite a significant decrease from 2018 to 2021, there was a subsequent increase of 27% in the Cash Ratio of Kimia Farma Tbk

5.3 Activity Ratio

The effectiveness of a company in assessing sales performance in relation to existing inventories and assets was measured during the period from 2018 to 2022. The Figure 7 shows that Kimia Farma Tbk has a superior performance related to managing asset efficiency within the company by measuring the collection period, inventory turnover. Meanwhile, related to total asset turnover, Kimia Farma Tbk has a lower figure than Indofarma Tbk.

Figure 7. Activity Ratio PT Kimia Farma Tbk (Author, 2023)

Figure 8. Activity Ratios PT Indofarma Tbk (Author, 2023)

In Figures 7 and 8 it is illustrated the growth in the value ratio which is quite volatile between these two companies. Indofarma Tbk reached its peak value of 119 in 2020, representing an 80% growth compared to the initial period. However, the collection period experienced a sharp decline to 47.7 in the following year. Conversely, Kimia Farma Tbk reached its peak collection period at 110 and subsequently decreased, reaching 69.4 in 2022, which is approximately 14% higher than Indofarma Tbk.

In regard to Inventory Turnover, Indofarma Tbk initially experienced a decline but stabilized in the subsequent period, ultimately increasing to 71% by the end of the year. Similarly,

Kimia Farma Tbk observed an increase of around 40% in inventory turnover by the end of the year. Furthermore, these two companies experienced a gradual decline in Total Asset Turnover during the period from 2018 - 2022.

5.4 Equity Ratio

This measurement compares equity and assets, and the growth of the Equity Ratio of the both companies is illustrated in Figure 9. Kimia Farma Tbk demonstrates a relatively stable value of the Equity Ratio over the past five years, while Indofarma Tbk exhibits higher volatility. A lower value indicates better company performance.

Figure 9. Equity Ratio PT Indofarma Tbk dan Kimia Farma Tbk (Author,

From 2018 to 2021, Indofarma Tbk outperforms Kimia Farma Tbk, as depicted in Figure 9, where Indofarma Tbk has a lower ratio of around 9% and 4%. However, in 2022 Indofarma Tbk experienced a significant increase to 100%, which was 54% higher than that owned by Kimia Farma Tbk. This sharp rise in 2022 can be attributed to a substantial increase in equity, which is three times larger than before, along with a significant decrease in assets from 2021 to 2022.

5.5 Validation Testing

Referring to the Decree of the Ministry of SOE No.KEP-100/MBU/2020, in measuring the financial health of SOE, it requires an assessment of several ratios, profitability, liquidity, activity, and solvency. In figure 8, several categories, levels and criteria for each SOE benchmark have been described, and the following table is an explanation of the results of the tests that have been carried out to find out the total score at Indofarma Tbk and Kimia Farma Tbk and to find out the level and category of these companies.

Table 8. Level of Financial Health Assessment of SOE based on Decree of Ministry

Category	Level	Criteria
HEALTHY (SEHAT)	AAA	Total Weight > 95
	AA	80 < Total Weight ≤ 95
	A	65 < Total Weight ≤ 80
UNWELL (KURANG SEHAT)	BBB	50 < Total Weight ≤ 65
	BB	40 < Total Weight ≤ 50
	B	30 < Total Weight ≤ 40
UNHEALTHY (TIDAK SEHAT)	CCC	20 < Total Weight ≤ 30
	CC	10 < Total Weight ≤ 20
	C	Total Weight ≤ 10

Table 9. Total Test Score of Kimia Farma Tbk

Indicator	PT Kimia Farma Tbk				
	2018	2019	2020	2021	2022

6. LIMITATION

This study examines the financial performance of the pharmaceutical industry, specifically by analysing two companies as a representative sample. The research period is exclusively limited to five years (2018-2022). However, it is important to acknowledge the limitations of this study and consider expanding the scope by including a broader range of industries, a longer time frame, or a larger number of companies. Additionally, to comply with the Ministry of SOE's decree, it is recommended to incorporate additional variables outlined in the decree, such as operational and administrative factors.

7. CONCLUSION AND RECOMMENDATION

According to the financial performance study conducted on two state-owned pharmaceutical companies, PT Kimia Farma Tbk and PT Indofarma Tbk, as shown in table 9 and 10, in 2018, the findings indicate that in 2018, both companies were in a healthy financial condition, denoted as level A. However, in the subsequent year, there was a significant decline in their financial health scores. Kimia Farma Tbk's score decreased from 54.5 in 2018 to 29 in 2020, while Indofarma Tbk's score decreased from 47.5 in 2018 to 33.25 in 2020, leading both companies to be categorized as level BB, representing an unwell condition.

Moreover, in contrast to the growth observed in the health sector during the period from 2018 to 2021 (as depicted in Figure 1), PT Kimia Farma Tbk and PT Indofarma Tbk also experienced a negative impact during the Covid-19 period, spanning from 2020 to 2022. In 2020, both companies' financial health deteriorated further, with a BB rating, indicating an unwell condition. In 2021, Kimia Farma's financial condition improved to BBB, while Indofarma Tbk remained at the same level as the previous year. However, in 2022, the financial health of both companies reached their worst state, categorized as unwell condition, with Kimia Farma Tbk's total score declining to 28.5 and Indofarma Tbk's total score dropping to 24.

Considering the profitability ratio, both Indofarma Tbk and Kimia Farma Tbk need to focus on annual sales growth and effectively manage their assets and equity. In the case of Indofarma Tbk in 2022, they experienced a substantial loss, leading to a significant decrease in equity. This analysis suggests that both companies should implement stringent monitoring and evaluation measures in accordance with the Decree of the Ministry of State-Owned Enterprises. Additionally, it may be worthwhile to introduce additional variables to assess the impact on these companies.

ABSTRACT

Corona virus that had occurred at the end of 2019 then quickly become World-wide Pandemic. This pandemic caused panic situation among the people, even though there was a modern medical technology available that was expected to solve the problem. Then, most people in Indonesia were turned into traditional herbal as an alternative treatment, as well as to boost body's immunity to prevent from being infected. That makes an assumption that traditional herbal industry were making good business during the period. However, the Government's restriction on people activities and mobility limitation, were applied to all businesses, includes PT Sidomuncul, Tbk one of the players in traditional herbal and pharmacy industry. The company has been thriving in managing their business before the pandemic. This study aims to analyze and measure the financial healths of the company by reviewing key financial ratios, such as profitability, liquidity, solvency, and activity ratios based on its audited financial reports during periods of 2019 – 2021. The authors believe that the findings will be helpful to illustrate the impact of the covid-19 pandemic.

Keywords: Financial Ratio Performance, Covid-19, Herbal Industry, PT Sidomuncul, Profitability

INTRODUCTION

Traditional herbal medicines are one of cultural legacies in Indonesia, where ethnics & tribes has their own recipe that consist of specific ingredients available in their region and this various kind of herbal has enriched cultural heritage of Indonesian. In Java civilization, the herbal medicine are widely known as Jamu & been long to believe it increase immunity, strengthen body stamina, and even treat disease. With these benefits many people took herbal medicine as a daily intake as a preventive measure. Nowadays, Jamu production are not only as homemade industry that being sold door to door, by the side of the road, or in mini stalls in the market, but it has become multi-million dollar industries, which PT Sidomuncul is one of the leading players in the herbal medicines market (Promising-prospects-of-the-indonesian-herb-and-spices-industry, 2022)

When coronavirus emerged in the end 2019 & quickly spreads worldwide by 2020, it has caused disaster impact to almost all industrial level where business operational disrupted & paralyzed world economic. That happened as no medicine been found to cure the ailment until vaccination being developed in 2020 & made to public released globally in 2021 (COVID-19-vaccine, 2023) and during the period, people turned to take herbal medicine instead to treat & prevent from being infected. The healthy life-style also contribute to customer behaviour take a natural based product instead (Daryanto, 2021). It make assumption that traditional herbal producer were one of few industry that have sales increment in Indonesia. (inilah-sektor-industri-yang-bertahan-di-tengah-pandemi-covid19, 2020)

As Indonesia government put priority to push forward Food & Beverage industry include traditional herbal during pandemi, it requires assesment of the company's financial health through comparative research by using the Decree of the Ministry of SOEs No. KEP-100/MBU/2002, which will use four significant financial ratios of profitability, liquidity, activity & solvency. (Daryanto C. N., 2021). At last, this study aims to see if there are significant increase on PT Sidomuncul's sales performance through the herbal segment product during pandemic era 2019 -2021.

1. LITERATUR REVIEW

Jamu is the Indonesian term for indigenous medicines usually prepared from herbal materials such as leaves, bark, roots and flowers. Each of the more than 300 major ethnic groups that make up modern Indonesia has its own repertoire of traditional recipes, preferred ingredients and methods of use for these varied herbal preparations (Welsch, 1988). According to data from the Indonesian Institute of Sciences (LIPI), Indonesia has 33 thousand species of medicinal ingredients that have the potential to become herbal medicinal ingredients. Currently, only about 800 species are used as herbal ingredients and 30 species are used as standardized herbal medicines, and only 12-14 species are used as phytopharmaca (natural medicine ingredients that have been proven scientifically safe and effective by preclinical tests). From these natural resources, Indonesian herbal medicines have enormous potential both in the local and global markets. (Pamungkas)

PT SidoMuncul is one of traditional herbal medicine factory which was founded from a home industry managed by Mrs. Rakhmat Sulistio in Yogyakarta in 1940 where "Tolak Angin"

is the first herbal product use as cold medicine. In respond to high demand of their product, they increase the production capacity by enlarge the factory size that equipped with modern machinery & upgraded the herbal production process with the pharmaceuticals standard. On November 11, 2000, the Minister of Health and Social Welfare of the Republic of Indonesia, Dr. Achmad Sujudi inaugurate the SidoMuncul factory, which at that time received two certificates at once, namely as a company capable of compounding good traditional medicines and also as a company that has a good way of compounding medicines that is equivalent to pharmaceutical science. These two certificates made SidoMuncul the only herbal medicine factory with pharmaceutical standards. (<https://www.sidomuncul.co.id/id/history.html>, n.d.)

Along the time, Sidomuncul has penetrated to food/supplement & beverages business as well and has expanding to overseas business by established of marketing branch office in Philippines in 2017 & established of Muncul Nigeria Limited Company on 2018. (Sidomuncul Annual Report 2021).

Figure-1 : PT Sidomuncul Product Segment contribution 2021

Source: Author Analysis (2023)

2. RESEARCH METHODOLOGY

In order to verify if herbal medicine contribute to increment of Company's performance duringpandemic,the secondary quantitative method (<https://www.statswork.com/services/data-analysis/secondary-quantitative-data-collection/>, n.d.) were used to analyze the financial highlights stated on the Annual Report 2019–2021 of PT Sidomuncul, Tbk that can be access publicly in their official website. As to measure the company's financial health, the Financial ratios stated in the Decree of stated-owned Enterprise (SOEs) No. KEP-100/MBU/2002 were used as validation tools. Although this Decree of SOEs apply mandatory to asses financial health of all company under Ministry of SOEs, but it also being use to evaluate private equity as no health measurement established for private sector yet. Many research has use this Decree of SOEs as a referenced to validate financial health in many industry such as: Agrobisnis (Aulia, 2020), Aviation (Daryanto W. M., 2018), Food & Beverages (Donna Kartiningsih, 2020), Fast

Food franchise (Nasel, 2020), Telecommunication (Reapina, 2020), Hardware Retail Industry (Renatauli, 2020), as well as Pharmaceutical (Daryanto H. P., 2020)

To depict the state of a company, a descriptive Financial Ratio Analysis (FRA) was required, which included Profitability ratio, Liquidity ratio, Activity ratio, and Solvency ratio as evaluation metrics - shown in tabel 1 below :

Table 1. Total Weight and Health indicator

Classification	Indicator	Weight	Company Health Indicator		
		Non Infrastructure	Category	Rating	Score
Profitability	Return on Equity	20	Healthy	AAA	TS>95
	Return on Investment	15	Healthy	AA	80<TS≤ 95
Liquidity	Cash Ratio	5	Healthy	A	65<TS≤ 80
	Current Ratio	5	Less Healthy	BBB	50<TS≤ 65
Activity	Collection Period	5	Less Healthy	BB	40<TS≤ 50
	Inventory Turnover	5	Less Healthy	B	30<TS≤ 40
	Total Asset Turnover	5	Unhealthy	CCC	20<TS≤ 30
Solvency	Total Equity to Asset Ratio	10	Unhealthy	CC	10<TS≤ 20
Total Weight		70	Unhealthy	C	TS≤ 10

Source: The Ministry of State-Owned Enterprise Decree No. KEP 100/MBU/2002

Mike Piper through his book Accounting Made Simple, 2010, has made a brief explanation in calculating the Financial Ratios, as follow :

a. Profitability Ratios

A company’s return on assets shows a company’s profitability in comparison to the company’s size (as measured by total assets). These formula could give meaningful Company’s Profitability info regardless the size of business. Formula as follow :

$$\text{Return on Investment (ROI)} = \frac{\text{Net Income}}{\text{Total Assets}}$$

$$\text{Return on Equity (ROE)} = \frac{\text{Net Income}}{\text{Shareholder's Equity}}$$

Once calculated, the result will be measured to weight score of SOEs Decree standard.

Table-2 : Assesment Score of ROI

ROI (%)	Skor	
	Infra	Non Infra
18 < ROI	10	15
15 < ROI ≤ 18	9	13,5
13 < ROI ≤ 15	8	12
12 < ROI ≤ 13	7	10,5
10,5 < ROI ≤ 12	6	9
9 < ROI ≤ 10,5	5	7,5
7 < ROI ≤ 9	4	6
5 < ROI ≤ 7	3,5	5
3 < ROI ≤ 5	3	4
1 < ROI ≤ 3	2,5	3
0 < ROI ≤ 1	2	2
ROI < 0	0	1

Table-3 : Assesment Score of ROE

ROE (%)	Skor	
	Infra	Non Infra
15 < ROE	15	20
13 < ROE ≤ 15	13,5	18
11 < ROE ≤ 13	12	16
9 < ROE ≤ 11	10,5	14
7,9 < ROE ≤ 9	9	12
6,6 < ROE ≤ 7,9	7,5	10
5,3 < ROE ≤ 6,6	6	8,5
4 < ROE ≤ 5,3	5	7
2,5 < ROE ≤ 4	4	5,5
1 < ROE ≤ 2,5	3	4
0 < ROE ≤ 1	1,5	2
ROE < 0	1	0

Source : The Ministry of SOEs Decree No. KEP-100/MBU/2002

b. Liquidity Ratios

Use to determine how fast company fulfill their short-term financial obligations :

$$\text{Current Ratio} = \frac{\text{Current Assets}}{\text{Current Liabilities}}$$

$$\text{Quick Ratio} = \frac{\text{Current Asset} - \text{Inventory}}{\text{Current Liabilities}}$$

In this formula, the higher value result the better. The result will be measured by assesment below :

Table-4 : Assesment of Current Rasio

Current Ratio (%)	Score
125 ≤ Current Ratio	5
110 ≤ Current Ratio < 125	4
100 ≤ Current Ratio < 110	3
95 ≤ Current Ratio < 100	2
90 ≤ Current Ratio < 95	1
Current Ratio < 90	0

Table-5 : Assesment of Cash/Quick Ratio

Cash Ratio (%)	Score
Cash Ratio ≥ 35	5
25 ≤ Cash Ratio < 35	4
15 ≤ Cash Ratio < 25	3
10 ≤ Cash Ratio < 15	2
5 ≤ Cash Ratio < 10	1
0 ≤ Cash Ratio < 5	0

Source : The Ministry of SOEs Decree No. KEP-100/MBU/2002

c. Activity Ratios

Used to calculate how effective the company utilize their assets. The significant ratios are inventory turnover, collection period & asset turnover, formula as below:

$$\text{Inventory Turnover} = \frac{\text{Inventory}}{\text{Revenue}} \times 365$$

$$\text{Collection Period} = \frac{\text{Trade Receivable}}{\text{Revenue}} \times 365$$

$$\text{Asset Turnover} = \frac{\text{Revenue} \times 100\%}{\text{Capital Employed}}$$

Table-6 : Assesment of Inventory Turnover

Table-7 : Assesment of Collection Period

Inventory Turnover (days)	Adjustment (days)	Score	Collection Period (days)	Adjustment (days)	Score
ITO ≤ 60	35 < ITO	5	CP ≤ 60	CP > 35	5
60 < ITO ≤ 90	30 < ITO ≤ 35	4,5	60 < CP ≤ 90	30 < CP ≤ 35	4,5

3. ANALYSIS & RESULT

PT Sidomuncul has 3 segmentation product consist of Herbal Supplement, Food & Beverage & Pharmacy. Each has give good contribution to the company, but still dominated by Herbal segment which consistently increase every year. Herbal supplement has increased 7.7% in 2020 then jump to 21% sales increase in 2021. Followed by food & beverage segment with increment 14% in 2020 & 17%, as for the pharmacy segment although it has decrease 7.6% in 2020 but in 2021 recorded 26% increase. Figure shown in Chat below :

Figure-2 : Grafik Product Segment Contribution 2019 - 2021

Source : Author Analysis (2023)

a. Profitability Performance

In regards to profitability during period 2019-2021, PT Sidomuncul has maintain their good performance with ROE > 15% & ROI > 18% (versus SOEs Decree 100-KEP/MBU/2002) and the Profit margin also consistently with 31% achievement in 2021.

Figure-3 : Profitability Ratio of PT Sidomuncul, Period 2019-2021

Source : Author analysis (2023)

b. Liquidity Performance

The liquidity ratio PT Sidomuncul reviewed by calculating cash ratio & current ratio which of utilized to assess the ability of a company to fulfill its immediate financial commitments with ease by which PT Sidomuncul have good capacity to do that, where both of Current & Cash Ratio are above the Government maximum score.

Figure-4: Liquidity Ratio of PT Sidomuncul, period 2019 – 2021

Source : Author Analysis (2023)

c. Activity Performance

Less time is preferred for the collection period, which indicates how long it will take the company to get its payment in account receivables, which in 2021 PT Sidomuncul has manage well to reduce the timeline to 60 days from previous 73 days. Opposite result happen in Inventory turnover with 131 days means current inventory of PT Sidomuncul will be deplete within next 138 days. It may happen due to buffer stock preparation on raw materials. As for the asset turnover, Sidomuncul ratio manage above Government standar .

Figure-5: Collection Period, Inventory & Asset Turnover

Source: Author analysis (2023)

d. Solvency Trend

The debt/equity ratio use to asses in what extent a company has used debt to finance it’s operations (Mike Piper, 2010) From the annual report 2019 to 2021, company has manage fairly.

Figure-6: Solvency Ratio trend from 2019 to 2021

Limitation

All data used to for financial performance ratios calculation are using secondary data from the published Financial Report of the company, accesible through Company’s website. Financial ratio standard used in this study are refer to Ministry of State-owned Enterprise Decree No. KEP-100/MBU/2002, with on Non-Infra weighted score standard.

Graphic performance of Financial performance of PT Sidomuncul, Tbk, as below :

Figure-9 : Financial Highlights 2019 - 2021

Source : Author Analysis (2023)

CONCLUSION & RECOMMENDATION

Conclusion

Objective of this study is to verify whether Covid pandemi situation bring good impact on Traditional Herbal & Pharmacy industry of PT Sidomuncul, Tbk, by reviewing their Annual

Report period 2019 to 2021 and analysing their Financial Health by comparing to SOE Decree 2002 on Non-Infra group.

Reviewing their Financial highlights such as sales & profit margin saw that the Sales was increase progressively from 2019 to 2021, although on percentage wise, sales achievement in 2020 were only increase 8% compare 11% growth in 2019. Assumed it was due to Government regulation on National mobility limitation called “Large-scale social restriction” 2020 which applied to all business & governance. But this economic slowdown was happened not only in Indonesia but globally as well and along the time Government has loosening the restriction for some selected & essential activities such as Health sector, which was an opportunity for company to keep the production process to fulfilled high demand of herbal medicine as well as to distribute aid as part of their social responsibility. People’s change behaviour toward healthy life style also impact to awareness of healthy food consumption with “back to nature” slogan. These factors has resulted to the sales growth performance 21% on 2021 with 35% growth Net income which big contribution of 67% came form Herbal Supplement sales. These Financial highlight has supported assumption that pandemi covid-19 Do contributes to the business growth of PT Sidomuncul, Tbk during 2021.

Recommendation

Though activity performance of company categorize as healthy, but there’s still room for improvement on inventory turnover by accelerate depletion process of inventory by ensuring forecast accuracy to be more reliable. And with high solvency ratio, company could maximize the business capacity by optimizing the usage of assets effectively as to increase the sales revenue & generate more profits.

Global trends towards living a healthy life still continue growing where people are becoming more conscious of the importance of maintaining a healthy lifestyle to improve their overall well-being and prevent chronic diseases with a natural supplement. Opportunity for the company to growth are still wide-open so it need to keep increasing productivity, expand the distribution channel, particularly to accelerate penetration on abroad market – export destination countries.

ABSTRACT

Healthcare is a main component of our life, and a hospital has an important function to support it. However, every hospital needs to have a healthy financial condition to maintain business sustainability. This research aims to analyze and measure the financial ratios of PT. Siloam International Hospitals, Tbk, Indonesia for the periods of 2017 to 2021. The company has conducted Initial Public Offering (IPO) since the year 2013 and has been growing several units of hospitals since then, becoming one of the growing hospital chains spread nationwide.

The financial ratios will be calculated to understand and measure the company's performance, using the analysis tools to determine whether the company's financial condition is in good or bad shape for future business performance consideration. The financial ratios consist of liquidity, solvency, and profitability ratios, and will be calculated based on public financial reports of the company.

Keywords: Liquidity, Solvency, Profitability, Siloam Hospital, IPO

1. INTRODUCTION

Hospital Industry in Indonesia

Health is a state of complete physical, mental, and social well-being and not merely the absence of disease or infirmity. In Indonesia, health care has been one of the major focus nationwide and therefore a thorough health system has been established yet keeps growing. One of the main roles in the health system is the presence of hospitals. The hospital sectors have unique market characteristics that differ from market characteristics in other sectors (Kemenkes RI, 2022). According to the Committee of Indonesia Business Competition in 2020, users in the hospital industry in the country also come from various backgrounds, not only come from private companies but also from non-profit private companies and the government actively participates in organizing the hospital health industry which continues to experience growth in Indonesia. This condition is in line with the increasing accessibility of Indonesian people to hospital health services through the National Health Insurance (JKN) program scheme. The number of hospitals has shown growth in the year 2017 – 2021, with today there are 1.496 private hospitals in Indonesia showing that there is a spacious opportunity to develop the healthcare industry in Indonesia (Lesmana & Daryanto, 2019).

Figure-1: Development of General and Special Hospitals in Indonesia, 2017 – 2021

Source : Profil Kesehatan Indonesia 2021 (2022)

Healthcare Industry and Covid-19 Pandemic

The global Corona Virus pandemic has impacted various sectors. Since Indonesia claimed its first case in February 2020 the number starts rising day by day and mobility regulations increasing. Although those regulations have impacted the economic movement in many industries, some are still showing good trends, and according to the Indonesia Bureau of Statistics report, health and education are sectors that continue to grow in a positive direction with 16,54% YoY growth in Q4 2020. The health industry sector, especially the health services and medical devices, is the most attractive industrial sector for investors and has shown as a trigger factor for national economic growth from the year 2019 to 2021. Through the pandemic phenomena happening, this study aims to analyze the financial ratio performance of one of the

health service companies of PT. Siloam International Hospitals, Tbk from the year 2017 until 2021, where the last 2 years were the time during the pandemic.

About PT. Siloam International Hospitals, Tbk

PT. Siloam International Hospitals or Siloam Hospitals Group (Siloam) is Indonesia's leading private hospital network and has become the benchmark for quality healthcare in Indonesia. Its medical team consists of 2,700 general practitioners and specialist doctors, as well as 10,000 nurses and other support staff, and serves nearly 2 million patients annually. Starting from PT Sentralindo Wirasta in 1996, the company manages and operates 41 hospitals consisting of 15 hospitals in the Greater Jakarta Area and 26 hospitals spread across the islands of Java, Sumatra, Kalimantan, Sulawesi, Bali, and Nusa Tenggara. Of those 41 operating hospitals, 26 of them are already serving BPJS Kesehatan (JKN) patients, and shortly, there will be even more. The hospital's group has expanded its center of excellence from Oncology, and Parkinson & Movement's Disorder, accredited internationally, and also world-class facilities. The company listed its shares on the Indonesia Stock Exchange in September 2013, as PT Siloam International Hospitals Tbk with the code SILO. According to Indonesia Stock Exchange data in 2022, Siloam owns 32% market share from all top 5 private hospital groups that have gone public in Indonesia.

Figure-2: Market Share Based on Hospital Unit 2022

Source: Author Analysis (2023)

The relatively large growth in the number of hospitals under PT Siloam International Hospitals, Tbk has generated interest for researchers to discuss how the growth in financial performance can be seen from its profitability ratio because it represents the company's success and how it contributes to the progress of PT Siloam International Hospitals Tbk after carrying out its IPO, considering that it will contribute to increasing the company's working capital (Safitri, 2018). In connection with that matter, a study with the title of “Measuring Financial Ratio Analysis on PT. Siloam International Hospitals, Tbk, Indonesia for Future Business Consideration” is being developed here to analyze and measure the financial ratios of PT. Siloam International Hospitals, Tbk, Indonesia for the periods of 2017 to 2021. The financial ratios will be calculated to understand and measure the company's performance, using the analysis tools to determine whether the company's financial condition is in good or bad shape for future business performance consideration.

2. RESEARCH METHODOLOGY

The research methodology in this study is quantitative, namely systematic scientific research on every available part. The purpose of quantitative research is to develop and use numerical hypotheses (Ramadhani et al., 2023). The measurement and standard used in this study are referring to the Decree of Ministry SOEs No. KEP-100/MBU/2002. It is also understandable from the classification that the Hospital Industry is part of non-infrastructure enterprises. The data collection method used in this study was the documentation study method, collecting quantitative data obtained through consolidated financial statements of PT. Siloam International Hospitals, Tbk from their website.

Financial ratio analysis (FRA) is a tool commonly used to analyze a company's financial performance and assess the company's health rate by measuring the profitability ratio, liquidity ratio, activity ratio, and solvency ratio. Financial ratio analysis (FRA) is a good evaluation method to measure company performance. It is a specialty in accounting that is aimed at formulating a diagnosis and a prognosis relative to the situation and the financial performance of a company or an organization (Lesmana & Daryanto, 2019). Financial ratios could be used in many industries, proved by previous research in several industries such as oil and gas, pharmaceutical, consumer goods, and transportation (C. Daryanto & Daryanto, 2019; W. M. Daryanto et al., 2019, 2020; W. M. Daryanto & Wibisono, 2019; Lee, 2022). Nevertheless, only a few studies of financial performance analyze the private hospital in Indonesia.

Data in the form of consolidated financial reports are analyzed using the necessary financial ratios. According to the Ministry of SOEs Decree 2002, the information needed to calculate the financial ratio will be profitability, liquidity, activity, and solvency with indicators as mentioned below (Lee, 2022).

Table-1: Total Weighted Score

Classification	Indicator	Weight (Non Infrastructure)
Profitability	Return on Equity	20
	Return on Investment	15
Liquidity	Cash Ratio	5
	Current Ratio	5
Activity	Collection Period	5
	Inventory Turnover	5
	Total Asset Turnover	5
Solvency	Total Equity to Asset Ratio	10
Total Weight		70

Table-2: Health Indicator

Company Health Indicator		
Category	Rating	Score
Healthy	AAA	TS > 95
Healthy	AA	80 < TS ≤ 95
Healthy	A	65 < TS ≤ 80
Less Healthy	BBB	50 < TS ≤ 65
Less Healthy	BB	40 < TS ≤ 50
Less Healthy	B	30 < TS ≤ 40
Unhealthy	CCC	20 < TS ≤ 30
Unhealthy	CC	10 < TS ≤ 20
Unhealthy	C	TS ≤ 10

Source: The Ministry of SOEs Decree No. KEP-100/MBU/2002

From all the indicators, the score will be calculated into weight by dividing the score and total weight times 100 and the weight will be accumulated to determine the three categories of the company's financial health: Healthy, Less Healthy, and Unhealthy.

1. Profitability Ratio

The profitability ratio is the ability to assess a company's ability to earn profits from its sales or operations, balance sheet assets, or shareholders' equity, typically measured in the form of Return on Equity (ROE) and Return on Investment (ROI) with the formula below.

$$\text{Return on Equity (ROE)} = \frac{\text{Net Profit}}{\text{Equity turnover}} \times 100\%$$

$$\text{Return on Investment (ROI)} = \frac{\text{EBITDA}}{\text{Capital Employed}} \times 100\%$$

Calculation results then will be measured using this assessment in Tables 3 and 4.

Table-3: Assessment Score for ROE **Table-4:** Assessment Score for ROI

Return on Equity (%)	Score
15 < ROE	20
13 < ROE ≤ 15	18
11 < ROE ≤ 13	16
9 < ROE ≤ 11	14
7,9 < ROE ≤ 9	12
6,6 < ROE ≤ 7,9	10
5,3 < ROE ≤ 6,6	8,5
4 < ROE ≤ 5,3	7
2,5 < ROE ≤ 4	5,5
1 < ROE ≤ 2,5	4
0 < ROE ≤ 1	2
ROE < 0	0

Return on Investment (%)	Score
18 < ROI	15
15 < ROI ≤ 18	13,5
13 < ROI ≤ 15	12
12 < ROI ≤ 13	10,5
10,5 < ROI ≤ 12	9
9 < ROI ≤ 10,5	7,5
7 < ROI ≤ 9	6
5 < ROI ≤ 7	5
3 < ROI ≤ 5	4
1 < ROI ≤ 3	3
0 < ROI ≤ 1	2
ROI < 0	1

Source: The Ministry of SOEs Decree No. KEP-100/MBU/2002

2. Liquidity Ratio

The liquidity ratio is the ability of the company to pay its short-term obligation on time. It can be calculated through the following formula.

$$\text{Cash Ratio} = \frac{\text{Cash} + \text{Cash Equivalent}}{\text{Current Liability}} \times 100\%$$

$$\text{Current Ratio} = \frac{\text{Current Asset}}{\text{Current Liability}} \times 100\%$$

The result of the calculation then will be measured using this assessment below.

Table-5: Assessment Score Cash Ratio

Table-6: Assessment Score Current Ratio

Cash Ratio (%)	Score
Cash Ratio ≥ 35	5
25 ≤ Cash Ratio < 35	4
15 ≤ Cash Ratio < 25	3
10 ≤ Cash Ratio < 15	2
5 ≤ Cash Ratio < 10	1
0 ≤ Cash Ratio < 5	0

Current Ratio (%)	Score

3. Activity Ratio

The activity ratio is a financial metric used to evaluate companies' efficiency in leveraging assets to generate revenue and cash. Activity ratios are evaluated using collection period, inventory turnover, and total asset turnover.

$$\text{CollectionPeriod}(CP) = \frac{\text{Trade Receivable}}{\text{Revenue}} \times 365$$

$$\text{Inventory Turnover (ITO)} = \frac{\text{Inventory}}{\text{Revenue}} \times 365$$

$$\text{Total Asset Turnover (TATO)} = \frac{\text{Revenue}}{\text{Capital Employed}} \times 100\%$$

The result of the calculation then will be measured using this assessment below.

Table-7: Assessment Score of CP

Collection Period (days)	Adjustment (days)	Score
CP ≤ 60	CP > 35	5
60 < CP ≤ 90	30 < CP ≤ 35	4,5
90 < CP ≤ 120	25 < CP ≤ 30	4
120 < CP ≤ 150	20 < CP ≤ 25	3,5
150 < CP ≤ 180	15 < CP ≤ 20	3
180 < CP ≤ 210	10 < CP ≤ 15	2,4
210 < CP ≤ 240	6 < CP ≤ 10	1,8
240 < CP ≤ 270	3 < CP ≤ 6	1,2
270 < CP ≤ 300	1 < CP ≤ 3	0,6
300 < CP	0 < CP ≤ 1	0

Table-8: Assessment Score of ITO

Inventory Turnover (days)	Adjustment (days)	Score
ITO ≤ 60	35 < ITO	5
60 < ITO ≤ 90	30 < ITO ≤ 35	4,5
90 < ITO ≤ 120	25 < ITO ≤ 30	4
120 < ITO ≤ 150	20 < ITO ≤ 25	3,5
150 < ITO ≤ 180	15 < ITO ≤ 20	3
180 < ITO ≤ 210	10 < ITO ≤ 15	2,4
210 < ITO ≤ 240	6 < ITO ≤ 10	1,8
240 < ITO ≤ 270	3 < ITO ≤ 6	1,2
270 < ITO ≤ 300	1 < ITO ≤ 3	0,6
300 < ITO	0 < ITO ≤ 1	0

Table-9: Assessment Score of TATO

Total Asset Turnover (days)	Adjustment (days)	Score
TATO > 120	TATO > 20	5
105 < TATO ≤ 120	15 < TATO ≤ 20	4,5
90 < TATO ≤ 105	10 < TATO ≤ 15	4
75 < TATO ≤ 90	5 < TATO ≤ 10	3,5
60 < TATO ≤ 75	0 < TATO ≤ 5	3
40 < TATO ≤ 60	TATO ≤ 0	2,5
20 < TATO ≤ 40	TATO < 0	2
TATO ≤ 20	TATO < 0	1,5

Source: The Ministry of SOEs Decree No. KEP-100/MBU/2002

4. Solvency Ratio

The solvency ratio is the ability of the company to pay all obligations on time or the ability of the company to pay all long-term debt on time. The popular ratio will be as below.

$$\text{Equity to Asset Ratio (ETA)} = \frac{\text{Total Equity}}{\text{Total Asset}} \times 100\%$$

The result of the calculation then will be measured using this assessment below.

Table-10: Assessment Score of ETA

Equity to Asset (%)	Score
ETA < 0	0
0 ≤ ETA < 10	4
10 ≤ ETA < 20	6
20 ≤ ETA < 30	7,25
30 ≤ ETA < 40	10
40 ≤ ETA < 50	9
50 ≤ ETA < 60	8,5
60 ≤ ETA < 70	8
70 ≤ ETA < 80	7,5
80 ≤ ETA < 90	7
90 ≤ ETA < 100	6,5

3. RESULT AND DISCUSSION

The sample of this study is PT Siloam International Hospitals Tbk where the researcher used secondary data from consolidated financial statements published on Siloam’s website and Indonesia Stock Exchange. Provided data has given sufficient source that is related to the objective of this study. The consolidated financial statement of PT. Siloam International Hospitals, Tbk year 2017-2021 are as follows.

Table-11: Consolidated Financial Statement Year 2017-2021

(In Millions Rupiah, unless Foreign Currency, Shares per Unit and Otherwise Stated)	2017	2018	2019	2020	2021
REVENUE	5.848.006	5.964.650	7.017.919	7.110.124	9.381.891

RATIO LIABILITY TO ASSETS	16,89%	17,91%	22,66%	28,59%	29,88%

Source: Author Analysis (2023)

PT. Siloam International Hospitals, Tbk generated 60% revenue growth from 2017 to 2021 but experienced loss in 2019 due to high equity numbers. Further analysis with Decree SOE is explained as follows.

Profitability Ratio

PT. Siloam International Hospitals, Tbk profitability ratio is calculated through Return on Equity (ROE) and Return on Investment (ROI) from 2017 to 2021. In the year 2019, although the company generated revenue growth, it experienced loss due to a high increase in principal load. The profitability trend is shown in the below figure.

Figure-3: Profitability Ratios year 2017-2021
Source: Author Analysis (2023)

PT. Siloam International Hospitals, Tbk has shown bounce-back growth from 2020 onward or since the Covid-19 pandemic started when the health service demand was increasing, especially for inpatients. As mentioned in the Decree, the minimum standard to get the best score is 15% for ROE and 18% for ROI. The ROE and ROI of PT. Siloam International Hospitals, Tbk has been below the standard for five years. The highest ROE is in the year 2011 and it has shown 9% growth since 2017. The highest ROI is also in the year 2011 with 10,8% growth since 2017. The company gained a loss in 2019 which led to a minus ratio as well. PT. Siloam International Hospitals, Tbk can increase the ROE and ROI if they get a bigger profit per Rupiah of sales. Both ROE and ROI also can be improved by increasing the investment turnover. In turn, the investment turnover can be increased in either of two ways: (1) by generating more sales volume with the same amount of investment or (2) by reducing the amount of investment required for a given level of sales volume.

Liquidity Ratio

PT. Siloam International Hospitals, Tbk liquidity ratio is generated by calculating the current ratio and cash ratio. The result is shown in the below figure.

Figure-4: Liquidity Ratios year 2017-2021
Source: Author Analysis (2023)

Liquidity refers to the company’s ability to meet its current obligations. Thus, liquidity tests focus on the size of, and relationships between, current liabilities and current assets. PT. Siloam International Hospitals, Tbk has bigger assets compared to liabilities, and that is reflected in consistent current ratios above 200% in the years 2017 to 2021. Their cash ratio maintained at

a 51% average in 2017-2019 but then increased since the Covid-19 pandemic with a 70% average in 2020-2021. In reverse, their current ratio overall shows a decrease from a 530% average in 2017-2019 to 342% in 2020-2021. In summary, the company can use its current assets which presumably will be converted into cash to pay the current liabilities.

Activity Ratio

PT. Siloam International Hospitals, Tbk liquidity ratio is generated by calculating the collection period, inventory turnover, and total asset turnover. The result for the collection period and inventory turnover days is shown in the below figure.

Figure-5: Collection Period and Inventory Turnover year 2017-2021 (days)

Source: Author Analysis (2023)

The collection period is showing how long the company will receive its payment in account receivables and less is preferred. The result increased from 57 days in 2017 to 74 days in 2018. After they hit the highest number, it started to gradually decrease from 2019 to 2021. In short, the company has gone better in 2021 with 45 days collection period, so they can use it efficiently to satisfy the short-term debt.

The result also shows the linearity of inventory turnover in the period 2017 until 2021. This period shows the comparison of inventory turnover before and after the Covid-19 pandemic. In the figure, we can see that the company’s inventory turnover is slightly better, starting with 12 days period in 2017 and decreasing to 11 days period in 2021. This result shows how fast the inventory for the company operations such as the stock of disposable equipment and the pharmacies are stagnant before and after the Covid-19 pandemic.

Figure-6: Total Asset Turnover year 2017-2021

Source: Author Analysis (2023)

The figure above shows the Total Asset Turnover for PT. Siloam International Hospitals, Tbk and it shows an increase from 87% in 2017 to 133% in 2021. This result is showing that the company is very efficient in utilizing their asset to generate sales.

Solvency Ratio

Solvency pertains to the company’s ability to meet the interest costs and repayment schedules associated with its long-term obligations. PT. Siloam International Hospitals, Tbk solvency ratio is calculated by Equity to Asset (ETA) ratio and the result is as shown below.

Figure-7: Solvency Ratio Trend Year 2017-2021

Source: Author Analysis (2023)

The result is showing a 6% average in the year 2017 to 2019 and increased to 10% since the Covid-19 pandemic began in 2020. The overall solvency ratio of PT. Siloam International

Hospitals, Tbk is having an average of 8% solvency for 5 years, which can be considered financially stressful.

Validation Testing

The table below illustrates the financial assessment of PT. Siloam International Hospitals, Tbk on the year 2017-2021 based on SOE Decree (2002). The company has an average weight of 37 in the year 2017-2019 then increased to 66 in the year 2020-2021 or since the Covid-19 pandemic began.

Table-12: Validation Test Result Year 2017-2021

Validity Testing		2017		2018		2019		2020		2021	
		Ratio	Score	Ratio	Score	Ratio	Score	Ratio	Score	Ratio	Score

Status		Less Healthy		Less Healthy		Less Healthy		Less Healthy		Healthy	

Source: Author Analysis (2023)

Limitation

The components in the calculation of the financial performance ratio are using secondary data from the financial report of the company, it cannot include the breakdown of revenue. This study also has not included any other factors such as Operational and Advertising. The financial ratio standard in this study is based on Decree SOE in 2002 that is referring to Stated Owned Enterprises (SOEs). However, PT. Siloam International Hospitals, Tbk is a private company and therefore the standard was used to objectively grasp the financial performance and soundness of a company.

4. CONCLUSION AND RECOMMENDATION

Conclusion

The main objective of this study is to analyze the financial ratio for future business consideration and the standard is referring to Decree SOE in 2002. On overall scoring, the company is less healthy for the years 2017 to 2019 with decreased health level from BB to B. However, the company bounce back in 2020 with BBB health level and even got better with A in 2021 which also changed their status to Health. The increase happened since the Covid-19 pandemic began in 2020.

PT. Siloam International Hospitals, Tbk also experienced a loss in 2019 shown in the generation of a negative profitability ratio due to a high number in operation expenses. However, the company starts to recover from 2020 onward due to increased health services demand during the Covid-19 pandemic. This is mainly because the impact of the Covid-19 pandemic has been felt right across the healthcare business.

Recommendation

Results given from this study is showing the combination of less healthy and healthy financial performance status, hence the company should be able to take careful consideration to improve its operations which will impact performance. PT. Siloam International Hospitals, Tbk needs to work on their financial healthiness level. The company needs to have better management in restructuring its assets to generate more profit. They need to use more of the asset to their maximum potential by giving more services using the assets or maybe renting the assets to other companies to generate more profit.

Although the Covid-19 pandemic might have been beneficial in contributing upside, people now have higher self-awareness in carrying out health checks, and the number of healthcare service providers also increasing. Key strategies to create a value proposition that can be implemented will be focused on improving service and convenience for patients.

Study of Work Motivation of Construction Support Workers That Influences on Work Productivity Viewed from Maslow's Theory (Case Study on The "*Green House*" Building Project in City "X")

Mrs. Liena PRAJOGI
PPM School of Management
prajogiliena72.ppm@gmail.com
Orcid: 0009-0000-1169-8203

ABSTRACT

Work motivation is an important factor in increasing productivity in the construction industry. The work motivation of supporting workers can increase if the needs that can be met are known so that it affects the productivity of workers properly. In accordance with the background, this study was intended to determine the level of needs in terms of Maslow's theory by conducting interview with 1(one) person as the Head of Corporate Human Resource and Building Implementation Modelling (BIM) and questionnaire surveys of 30(thirty) respondents on support workers for the "Green House" building construction project in city "X". The results showed that support workers have work productivity below the target and tend to stagnate, this is because there are motivational factors that have not been met, namely Physiological Needs while motivational factors that have been met in the form of Needs for Actualizations, Belonging / Social Needs and Safety Needs can make support workers work for a long period of time. This paper discusses the results of the research obtained and provides several proposals to increase the motivation of supporting workers which will affect work productivity.

Keywords: Life Needs, Motivation, Productivity

INTRODUCTION

This study aims to examine the work motivation of construction support workers who influence the increase in work productivity by using *Maslow's Theory*. The subject of this study will use data and support workers from the *Green House building project* in city "X" by the contractor PT "APG" which has special specialization in the field of high-rise building construction.

The structure of this research will start from the background of the company before continuing with diagnosing problem formulation, identifying problem solutions and designing recommendations for proposed improvements that need to be carried out by the company using the *Organizational Development framework*. The research results can be explained based on the results of a survey of support workers by applying *Maslow's Hierarchy of Needs Theory*.

This research will end with recommended steps for further improvement proposals that can be carried out by the company based on the results of interviews with 1 Head of *HR* and *BIM* and respondents' answers to the questionnaire conducted to 30 support workers during the implementation of the *Green House building project* in the city "X".

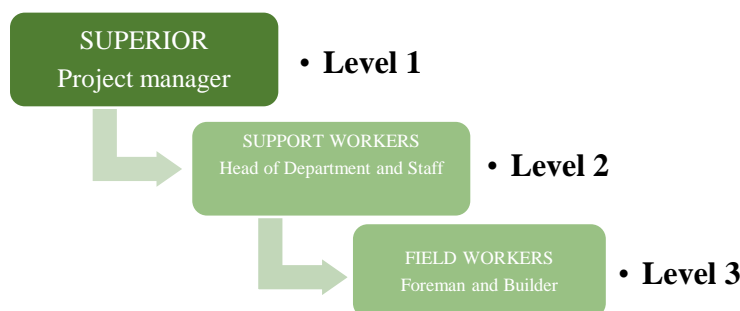

1. BACKGROUND

1.1 Company Background

This multi-store building construction project is made with the concept of "Go Green", implemented in a city located in West Java Province where it will become an integrated *Satellite City* or *Independent City* covering essential and non-essential sectors managed by PT "APG". PT. "APG" is an Indonesian national company engaged in construction services, infrastructure development, property, real estate and *EPC (engineering, procurement & construction)*. In discussing this research, it will focus on building construction services.

The building construction with the concept of "Go Green" under PT. "APG" is headed by 1 Project Manager who employs 250 workers consisting of 50 support workers who are located in the office and 200 construction workers who are in the field. The project implementation period starts from 6 September 2021 to 29 November 2022, which is 450 calendar days. In order to better understand the object of research in the implementation of the *Go Green building project*, the organizational structure of the implementation of this project can be briefly explained at the employee level, namely:

Figure 1.1. Level Structure of *Green House Project Employees*

Source : Data Interview by Himawati. Nur. Henny. (2022).

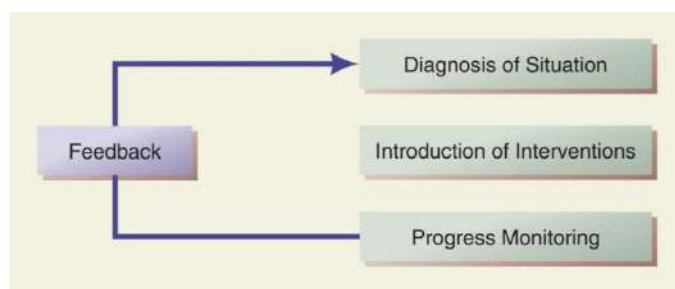

The benchmark for the success of a development project needs to be balanced with the work productivity of an adequate workforce, both for support workers and for implementing

development projects. The main focus of productivity in the construction industry is worker productivity (*labor productivity*), because workers (*labor*) are the resource that has the greatest influence on the achievement of management work results in the construction of a project . So far, research discussions have only discussed project implementing workers, especially field workers or called " *laborers* " as Andi and Dwi Djendoko have written in their writing entitled Worker Motivation in Several Construction Projects in Surabaya and Risdiyanti Wulansari in writing entitled Review of Worker Motivation Construction Project Against Abraham H Maslow's Theory of Needs. Project support workers located in offices are important to analyze because these workers are the bridge between level 1 and level 3 so that they can help realize the company's targets set by superiors. Therefore, this study will focus on support workers who are in the office (level 2) as stated in the implementing organizational structure (Figure 1.1) and hopes to enrich further research discussions.

1.2 Problems Faced by the Company

To identify the problems faced by PT. "APG ", used the theory of *Organizational Development (OD)* which is a model of change and development within an organization .

Figure 1.2. Organizational Development Stages

Source : Organizational Behavior. Michael A. Hitt. (2011)

In organizational development research according to the book *Organizational Behavior* by Michael A. Hitt, the author focuses on 2 stages carried out:

1. Diagnosis of the company and market situation (*Diagnosis of Situation*)

Diagnostic tools for Enterprises include interviews, surveys in which the analysis of issues is process oriented, and accurate records (e.g. performance records) whether taken on an individual or group basis.

2. Interventions (*Introduction of Interventions*)

The intervention stage can be determined by identifying the need for problem solving and designing recommendations for improvement. Organizational development interventions include various forms of proposed strategies, systems or other programs.

Source : Data Interview by Himawati. Nur. Henny. (2022).

In determining the productivity level of PT "APG", KPI data and the overall productivity curve have been conducted interviews with the Head of *Corporate Human Resources (HR)* and *BIM* at PT "APG ". KPI is the result of a review of performance which can reflect the level of employee productivity.

The company's KPIs have been reviewed 4 times a year, starting from Q1, Q2, Q3 and Q4, where assessments are carried out for work evaluations in 3 months and additional wages or incentives every 6 months for performance results. From the difference between the plan and the realization, there is a deviation in the form of the difference between the target and the average realization for each evaluation which is 42.5%, 35.83% and 35% respectively for Q1, Q2 and Q3, while for Q4 there is no data because there is no data yet. there is a conclusion. Even though there is a decreasing deviation which indicates an increase, the average increase is smaller than the 6.68% increase from Q1 to Q2 and there is only an increase of 0.83% from Q2 to Q3. Based on the results of interviews, currently the progress of project completion is in the range of 45% so it is likely that project completion will experience delays which will have the potential for losses.

To further investigate the level of performance within the team, he provides a *Productivity curve* or so-called *Work Performance curve* as shown below:

Table 1.2. Work Performance Curve

Source: Data Interview by Himawati. Nur. Henny. (2022).

In analyzing this table, there are 4 sections that can be underlined. Section C marked in pink is the difference from the *Work Performance curve* compared to the target with the realization as indicated by the orange arrow. It can be seen that the extension of the pink C line is getting wider, indicating that it is farther behind the target, even though as a whole there is a trend that the performance curve is still growing.

From part D in green, it can be seen that the performance gradient tends to be a straight line. Because this is a performance curve, gradients can *show the rate of increase of productivity* (like the “Y” axis which indicates the amount of performance based on KPI units) and *over time* (like the “X” axis which shows the time where the column headings in the top table are month and date). This condition can be seen on both sides of D that the level of performance tends to *stagnate* (same growth) prior to decreasing productivity, which can be seen from the decreasing gradient of the curve towards a straight line as indicated by the black arrow.

After using the *OD model* stage 1, diagnosing and analyzing the *KPI numbers* and the *productivity curve*, it was found that there were *two problems*, namely, first, *productivity was behind target* and second, *productivity tended to stagnate*.

However, from the results of further analysis, an interesting picture is that the regions in sections A and B have experienced an increase in productivity due to long holidays, including Christmas and New Year holidays in December and January where previously there was the Idul Fitri holiday in May. From the results of the interviews, the answer was that for the two time periods the company had provided holiday allowances and bonuses. From *Maslow's Hierarchy of Needs Theory* approach which explains that the existence of wages and bonuses

and additional incentives will motivate workers which affect increased productivity. This will be studied further in the method and discussion of research results.

After diagnosing the problem at stage 1 and moving on to stage 2, namely to further identify problem solving and design recommendations in the form of suggestions or suggestions for improvement, this study will use *the Hierarchy of Needs Theory. Maslow* in order to know the most important factors of worker motivation to increase productivity.

1.3 Research Objectives

This study aims to determine the work motivation factors for construction support workers that affect work productivity in terms of Maslow's theory. In this study, the authors used a survey by sending questionnaire data to 30 support workers in implementing this project and interviewing 1 Head of Corporate HR and BIM.

2. LITERATURE REVIEW

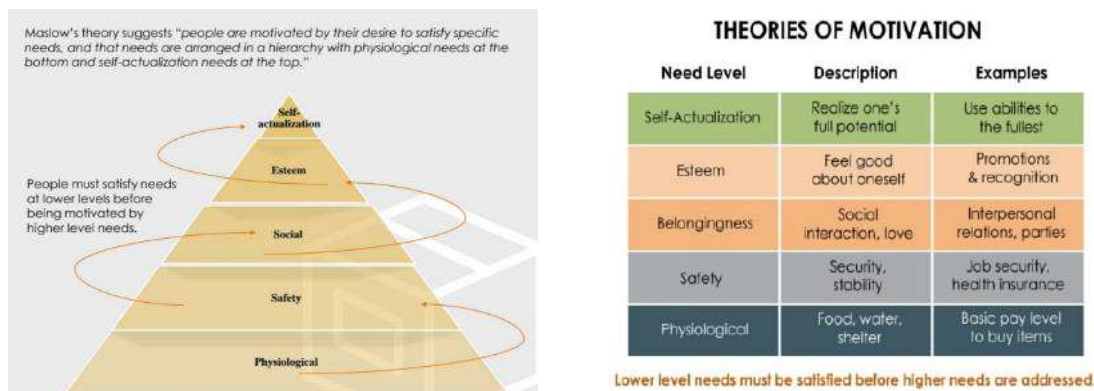

2.1 Maslow's Theory

Motivation is an impulse that makes people act or behave in motivational ways that refer to the cause of a behavior, such as factors that encourage someone to do or not do something. In another sense, motivation is a concept used to explain actions in or within an organization to initiate *and* direct *behavior*. Behavior with greater intensity is perceived as the result of a higher level of motivation. This motivation is manifested by action to get what is meant by satisfaction of these needs.

From the general understanding of motivation mentioned above, several approaches have been developed regarding the theory of Work Motivation. A number of experts since the early 1900s have expressed various theories of work motivation. These theories developed mainly in the fields of psychology, human resource management and organizational behavior. These work motivation theories can be grouped into three major sections, namely *Content Theories* , *Process Theories*, and *Contemporary Theories*.

In this work motivation research using *content theories*, namely focusing on the Hierarchy of Needs Theory put forward by Abraham H. Maslow in 1954. This theory is often known as Maslow 's *Hierarchy of Needs Theory* or called *Maslow's Theory* which can be seen in the picture as following:

Figure 2.1. Maslow 's Theory Figure 4. Maslow 's Theories of Motivation

Source: Organizational Behavior and Design. McGraw-Hill Education. (2019).

In this theory it is argued that in every human being there is a hierarchy of five categories of needs, namely *Physiological Needs*, *Safety Needs*, *Social Needs*, *the Need for Esteem*, and *Self-Actualization*. These five categories of needs are further divided into two major parts. *Physiological* and *Safety Needs* are part of *lower-order needs*, while *Social Esteem* and *Self-Actualization* are part of higher-order needs.

3. RESEARCH METHOD

The method in this study consists of several stages, namely:

- a. Conducting a literature review on worker motivation in construction projects from research that has been conducted which aims to find research gaps.
- b. Develop research instruments that will be used by developing research that has been done. The purpose of using instruments from research that has been done before is with the consideration that the research instruments have been tested for validation.
- c. Determine the sampling method.
- d. Collecting questionnaire survey data given to support workers in project implementation. The questionnaire contains 49 general questions of respondents about the hierarchy of needs which can be grouped into 5 major groups according to *Maslow's theory*. This is done to find out which motivation is most important so that it can affect the morale of the workers.
- e. Respondents were asked to provide an assessment based on the level of importance of each factor. The level of importance is arranged based on a scale of one to five. Score one for strongly disagree, two for disagree, three for disagree, four for agree and five for strongly agree.

4. RESULTS AND ANALYSIS

4.1 Preparation of Questionnaires and Motivational Factors

This study collected data with a questionnaire survey. The questionnaire contains 49 general questions from respondents which can be processed into 13 motivational factors in the five major groups as shown in the table below.

Table 4.1. Classification of 49 questionnaire questions into 13 motivational factors in 5 large groups based on *Maslow's Theory*

Maslow's Hierarchy Of Needs
<p>Physiological Needs</p> <p>Good wages Meet basic needs (clothing, food, shelter) Bonus and additional wages Rest and health</p>
<p>Safety Needs</p> <p>Good job Good safety program</p>
<p>Belonging/Social Needs</p>

Relationships with fellow workers Togetherness program Good supervision
Needs for Esteem Recognition for work
Needs for Self-Actualization Training program and opportunities for self-development Challenging job Acceptance of proposals by superiors

Questionnaire questions can be grouped into 13 motivational factors, which describe the five major groups. Based on *Maslow's theory*, the major groups are *Physiological Needs*, *Safety Needs*, *Social Needs*, the *Need for Esteem* and *Self-Actualization*. This survey aims to find out how far the company has fulfilled the motivation of the workers by providing an assessment based on a scale of one to five. Score one for *STS (Strongly Disagree)*, two for *TS (Disagree)*, three for *KS (Less Agree)*, four for *S (Agree)*, five for *SS (Strongly Agree)*.

4.2 Processing and Analysis of Research Results

The data obtained from the questionnaire was processed by looking for *the Relative Importance Index (RII)* of each factor. The RII of each factor is measured by comparing the total factor value with five times the sample size, so that the RII value will range between 0 (minimum) and 1 (maximum) where the higher the RII value the more satisfied office employees will be with the motivational support given to that factor. The smaller the RII value, the more dissatisfied and unfulfilled these motivational factors are. The difference between the maximum value and the RII value (1-RII) indicates an opportunity for companies to increase these motivational factors so that workers are satisfied and motivated to be more productive. *the Green House* building construction industry in city "X" is carried out by grouping the 13 motivational factors above into five groups based on *the Hierarchy of Needs Theory. Maslow*, then from the factors in each group the average is sought. The motivational factor with the largest average *RII* is the most fulfilled motivational factor among office workers at PT "APG".

4.3 Discussion of Research Results

The object of this research was conducted by conducting a survey distributing questionnaires to 30 respondents consisting of 24 men and 6 women.

The majority of support workers are contract workers, followed by contract workers based on SPK (Work Implementation Letter) or projects and PKJP (Project Level Contract Employees). **Work motivation factors that have been fulfilled based on the rating of the respondent's answers.**

Table 4.2. Fulfilled Employee Motivation Factors

Maslow's Hierarchy Of Needs	Rating Met
Physiological Needs	
Good wages	13
Meet basic needs (clothing, food, shelter)	12
Bonus and additional wages	11

Rest and health	10
Safety Needs	
Good job	4
Good safety program	8
Belonging/Social Needs	
Relationships with fellow workers	2
Togetherness program	9
Good supervision	6
Needs for Esteem	
Recognition for work	7
Needs for Self-Actualization	
Training program and opportunities for self-development	5
Challenging job	3
Acceptance of proposals by superiors	1

From table 4.2 it can be seen that acceptance of proposals by superiors is the highest factor, this indicates that this company's environment has provided a conducive work environment for sharing feedback, suggestions and others. The second motivational factor that has been fulfilled is good relations among workers, this is in line with the satisfaction factor based on the first rank because this shows that the relationship between workers is good. It can be seen that ratings 1 to 5 motivational factors that have been fulfilled cover 3 major groups of 5 *Maslow's Hierarchical Needs Theory*, namely *Needs for Self-Actualization* includes ratings 1, 3 and 5. The second is *Belonging/Social Needs* with the second rank and *Safety Needs* is the second rank. third.

Furthermore, it can be seen that a large group of motivational needs that tend not to be satisfied are *Physiological Needs* which consist of motivational factors for rest and health for rank 10, bonuses and additional wages for rank 11, needs for clothing, food and shelter at rank 12 with the last being very unsatisfactory. satisfied is a good wage is ranked 13th. This shows that the lowest level of *Maslow's theory* has not been fulfilled among support workers. To find out how different the factors that have been fulfilled and those that have not been fulfilled, further trace the results of the survey which can be seen in the next table.

Table 4.3. Unfulfilled Employee Motivation Factors

Rank	Motivator	Satisfaction score given					Total Responden (N)	Weighted Total	Mean (Based on number of questions dedicated per factor)	Relative Importance Index (Real) (The smaller, the more unfulfilled)	Difference from most satisfied (1-Real)
		1	2	3	4	5					
1	Good wages	6	15	47	51	1	30	386	96.500	0.643	0.357
2	Meet basic needs (clothing, food, shelter)	4	14	24	48	0	30	296	98.667	0.648	0.342
3	Bonus and additional wages	4	10	31	41	4	30	301	100.333	0.669	0.331
4	Rest and health	3	6	29	46	6	30	316	105.333	0.702	0.298
5	Good job	0	7	17	63	3	30	332	110.667	0.738	0.262
6	Good safety program	1	4	14	66	5	30	340	113.333	0.756	0.244
7	Relationships with fellow workers	0	15	44	186	25	30	1031	114.556	0.764	0.236
8	Togetherness program	0	7	13	89	11	30	464	116.000	0.773	0.227
9	Good supervision	0	3	17	58	12	30	349	116.333	0.776	0.224
10	Recognition for work	0	3	11	69	7	30	350	116.667	0.778	0.222
11	Training program and opportunities for self-development	0	10	23	136	41	30	838	119.714	0.798	0.202
12	Challenging job	1	4	10	142	23	30	722	120.333	0.802	0.198
13	Acceptance of proposals by superiors	0	0	4	40	16	30	252	126.000	0.840	0.160

Table 4.3 shows the factors of work motivation that have not been fulfilled. According to the results of this analysis there are differences between *Maslow's Hierarchy of Needs Theory* in the textbook and its application in the field. In this theory it can be seen that personal needs must be met starting from the lower level because these needs are basic needs to ensure the "Survival Needs" of a support worker, but in the implementation of this company can only meet the needs at the top level.

Means appropriate *Maslow's Hierarchy of Needs Theory*, because basic needs have not been met satisfactorily, workers do not get the satisfaction that exists in reality. However, from the survey results and by looking at the *RII* value, workers take quite a lot of satisfaction from the highest level of need with the highest *RII value* of 0.840 and a difference of only 0.160 from the highest satisfaction score.

This shows that in the realization that occurs even though the lower needs have not been met, support workers can still be motivated to work from the higher level needs, namely *Needs for Self-Actualization*. This can be seen from workers who have worked for a long time from project to project, ranging from workers who have worked for 11 years to 20 years.

However, judging from the comparison of the most satisfied *RII scores for Needs for Self-Actualization* with the most dissatisfied motivational factors in the *Physiological Needs group* (rank 5), there is a significant difference, namely 0.197. Compared with the difference of 0.033 between *the Need for Self-Actualization* and *Belonging of Social Needs* (rank 2), 0.037 between *Needs for Self-Actualization* and *Safety Needs* (rank 3) and 0.040 between *Need for Self-Actualization* and *Need for Esteem* (rank 4).

So we can see that actually the difference in satisfaction rating 1 with ratings 2,3,4 is almost the same with a minimum difference of 0.004 to 0.007.

This shows that there is a significant lack of companies to increase worker motivation in the *Physiological Needs group* compared to other groups.

5. CONCLUSIONS AND SUGGESTIONS

Therefore it can be concluded that there is an urgent need to increase the motivation of support workers at the *Physiological Needs Level* which is expected to support the productivity level from being behind the target and tends to stagnate for the better, namely to be able to obtain a productivity level that exceeds the target and will gradually increase continuously.

This conclusion is in line with the view that has been seen in the results of interviews with companies where there is an increase in productivity after the holiday period and the provision of THR (Table 1.2. Work Performance Curve).

Therefore, from the results of the study, the authors recommend suggestions or suggestions to increase efforts to increase the motivational factors of *Physiological Needs* based on good wages (rank 13), bonuses and additional wages (rank 11) by increasing the motivational factors of providing additional wages or incentives. Incentive payments are based on *KPIs* with a long frequency where previously incentive payments were only made once every 6 months, in the future this can be done every 3 months. If there is an increase in the percentage of reality for each *KPI* checking, the team will receive an incentive.

In total, their wages will increase and can increase work motivation in 3 aspects of satisfaction at once, namely good wages, being able to meet the necessities of life and bonuses and additional wages. This will have an effect on better work productivity, namely productivity will increase and will gradually exceed the set target.

6. RESEARCH LIMITATIONS

In this study only use motivational factors based on *Maslow's Hierarchy of Needs Theory* without regard to motivator and demotivator factors as other work motivational factors for support workers and field implementers which can increase work productivity in implementing construction projects in terms of Herzberg's theory and other theories.

ABSTRACT

The Indonesian transportation and logistics industry showed the most significant economic growth in 2022 compared to the 2021 on annual basis(y-o-y) which grew by 19,87%. The purpose of this research is to analyze the financial performance of a logistic and transportation service company listed on the Indonesia Stock Exchange (IDX), PT. Adi Sarana Armada Tbk (ASSA). Financial ratio analysis (FRA) is applied to review ASSA's financial performance position relative to competitors, industry averages and the impact of the covid-19 pandemic; and analyze the factors that affect the return and profitability of ASSA shares. The ratios chosen include Return on Assets, Debt to Equity ratios and Debt to Asset ratios, Asset Turnover, Current Ratios, Profit Margin, Return on Equity, Market Return and Stock Return. This study uses quantitative research methods and purposive sampling techniques to collect the required data. The sample consists of 40 quarterly financial reports, from 2012 to 2021. Based on financial performance analysis, ASSA is classified as expensive based on Price-To-Earnings Ratio compared to peer averages and industry averages in terms of profitability and liquidity. In addition to the positive profitability and solvency trends, the efficiency in the use of ASSA's assets is quite concerning. In relation to the factors that predict ASSA stock returns, this study finds that fundamental factors have a statistically limited effect on stock returns. It also reveals that only profitability is affected by fundamental financial factors such as asset turnover and financial leverage.

1. INTRODUCTION

In the current globalized world, a company's business performance and competitive position in the market represent two of the most critical indicators of a company's success. To maintain a competitive advantage, it is important to assess and analyze a company's financial standing and performance. In Indonesia, the main indicator for Indonesian stock market movement is Indeks Harga Saham Gabungan (IHSG) or can be called as Indonesian Composite Index (ICI), Indonesian Exchange (IDX) Composite, or Jakarta Stock Exchange (JKSE). According to Daniswara & Daryanto (2000) states that IHSG is an index of stock prices that arranged and calculated with trend movement result, where the index number can be used to compare the event that can be price changes from time to time. The value of a company, often assessed through its share price, is greatly influenced by its relative performance compared to competitors in the market. Furthermore, the competence of the company's management in effectively running the business is a key factor in sustaining a competitive advantage. To gain competitive advantage in the market, management of the company should manage the business in the most effective and efficient manner (Sari, 2019) and should pursue positive growth opportunities that enhance company's economic value. Understanding how numerous factors influence the economic value of a company, indicated by its share price and profitability, is therefore critical for management decision-making as well as investment opportunities purposes.

Financial performance is the ability of a company to manage its financial assets effectively during a specific period to find out and evaluate the level of success of the company's financial activities (Farruddin, Damayanti, & Ichwani, 2022). This study focuses on the transportation service company sector in Indonesia by analyzing a publicly listed transportation service company in Indonesia, ASSA, as this industry sector has not been explored. This research explored what has been demonstrated in prior studies about financial performance and stock returns, however applied in different industry sectors. There are five main financial ratios affecting a company's value or share price that are commonly measured: profitability, efficiency, liquidity, and solvency. A research conducted by Asmiranto & Somantri (2017) examines the effect of liquidity, solvency, profitability and market ratios on the stock price of a pharmaceutical company listed on the Indonesia Stock Exchange during the period 2012- 2016. The study incorporates Current Ratio (CR), Debt-to-Equity Ratio (DER), Total Assets Turnover (TATO), Return on Equity (ROE), and Earnings per Share (EPS) in the model as predictors of stock returns. Their research concludes that Current Ratio (CR), Debt-to-Equity Ratio (DER), Total Assets Turnover (TATO), Return on Equity (ROE) lack the statistical significance to explain the variance in the stock price of the selected sub-pharmaceutical companies. Only Earnings per Share (EPS) has a significant impact on these sub-pharmaceutical company's stock prices. Another research by (Halim, Sembel, & Malau, 2022) also reveal that ROA and ROE do not significantly influence stock returns. On the contrary, there are prior studies that found significant correlation between Return on Assets (ROA), return on equity (ROE), debt-to-asset ratio (DAR), debt-to-equity ratio (DER) and stock returns. They discovered that ROA and ROE have significantly positive effects on stock

return, while debt-to-asset ratio (DAR) and debt-to-equity ratio (DER) are negatively associated with stock returns (Banerjee, 2019); (Endria, Dermawan, Abidin, & Riyanto, 2019); (Nurhakim, Yunita, & Iradianty, 2016); (Nurhikmawaty, Isnurhadi, Widiyanti, & Yuliani, 2020) (Riza & Sudiby, 2020); (Saleh, 2015); (Shakeel & Ali, 2018). Another industry sector explored by past studies is the property and real estate industry. The study analyzed the effect of financial performance and firm size on stock returns of property and real estate companies listed in the Indonesia Stock Exchange from 2012 to 2016 (Suciati, 2018). The findings suggest that only leverage has a significant effect on stock returns while liquidity, profitability, and firm size have no significant impact.

The global economy faces challenges due to the Covid-19 pandemic in all countries, including Indonesia (Sumarni, 2020). The Indonesian government introduced a policy to impede the transmission of Covid-19, originally referred to as the Large-Scale Social Restrictions (LSSR) or *Pemberlakuan Pembatasan Kegiatan Masyarakat (PPKM)*. This policy has since been updated and is now known as the Community Activities Restrictions Enforcement (CARE).

Table 1. Cumulative Growth Rate (%) Transportation Sector 2018 - 2022

No	Information	Cumulative Growth Rate %				
		2018	2019	2020	2021	2022
	Transport and Warehousing	7,05	6,39	-15,04	3,24	19,87
	Rail Transport	10,74	4,49	-42,34	-3,37	69,80
	Land Transport	7,13	9,96	-5,34	4,55	8,73
	Sea Transportation	7,22	10,56	-4,57	2,89	5,12
	River and Lake Transportation Crossing	5,20	5,58	-13,00	-0,42	69,94
	Air Transportation	6,03	-9,76	-53,01	-8,01	66,90
	Warehousing and Transportation Support Services; Post & Courier	7,93	10,34	-17,61	5,03	40,54

Source: (Badan Pusat Statistik, 2022)

The transportation and warehousing sector grew 19,87 percent year on year (yoy) in 2022 compared with 2021 on annual basis, contributing 5.31 percent to the GDP. For this reason, the Indonesian transportation service company industry is purposely selected as the subject of this research to provide more accountable information for investors in the transportation service capital market. PT Adi Sarana Armada is an Indonesian transportation service company that offers various services in the transportation industry. The company operates rental businesses for cars, buses, and trucks, and also provides leasing services for land transportation excluding vehicles with four or more wheels. Additionally, they specialize in freight transportation of goods using trucks, pick-ups, and containers. The company also offers transportation consulting services and is involved in car trading and car repair.

This study aims to examine the potential relations between a company's fundamental financial factors and stock returns of a transportation service company in Indonesia. In addition, there is still limited research that observe the impact of these fundamental factors on stock returns of a transportation service company in Indonesia, that involve the

consequences of an unprecedented financial phenomenon (i.e. COVID-19) which are reflected in the financial metrics from 2019-2021. In the future, the author of this study hopes that this research shall become a helpful reference for the science of financial management, especially in regard to the development of more advanced stock returns statistical models in the Indonesian transportation service company industry.

1.1 Problem Statement

1. PT. Adi Sarana Armada Tbk (ASSA) is faced with intense competition with equal or stronger competitors who have sufficient resources to compete for market share.
2. Investors require more accurate and accountable information regarding company performance prior placing the investment.

1.2 Research Objectives

The objectives of this research are to analyze the financial performance of ASSA to produce valuable business insights which will be useful for investment decision-making purposes. Analyzing financial performance is normally used by investors to evaluate the economic position of a firm and potentially to predict the company future financial prospects. To analyze the financial performance of ASSA, this study follows the steps as stated below:

1. Comparing ASSA's financial performance and position against its competitors and industry.
2. Analyzing factors listed below that affect stock return of ASSA by using statistical tools.
 - a. Leverage affects Stock Return of ASSA
 - b. Liquidity affects Stock Return of ASSA
 - c. Turnover affects Stock Return of ASSA
 - d. Market Return affects Stock Return of ASSA
 - e. Profitability affects Stock Return of ASSA
3. Analyzing factors listed below that affect profitability of ASSA by using statistical tools.
 - a. Leverage affects Profitability of ASSA
 - b. Liquidity affects Profitability of ASSA
 - c. Asset Turnover affects Profitability of ASSA
 - d. Working Capital Turnover affects Profitability of ASSA

1.3 Research Method

This study adopts a quantitative method followed by main data collection techniques. According to Winter (2000), quantitative research improves the validity of research which utilizes traditional statistical and mathematical methods for measuring results conclusively. Population data in this study is transportation service company listed in Indonesia Stock Exchange. Purposive sampling technique is used to collect sample data. The collected sample will then be analyzed to extract insights in response to the problem statements as proposed.

2. LITERATURE REVIEW

Important measures of a company success in achieving profitability and financial sustainability are sourced from the company financial statements (Demmer, 2015). Financial ratios computed from these financial statements are, in fact, powerful decision-making tools. Ratio analysis helps to quantify the risk and growth factors of a firm, supporting investors in making strategic investment decisions as it provides a more comprehensive measure of performance (Arkan, 2016). Companies listed on stock exchanges publish annual and quarterly financial reports, allowing investors to gain a better understanding of the firm's business performance by performing a thorough financial analysis. Narayan and Reddy (2016) stated that studying the relationship between financial ratios and stock performance has been a prevalent subject for numerous studies in the finance field until today. Bayrakdaroglu et al. (2017) investigated the effects of financial information on stock prices and exclusively, how profitability ratios relate to the company's stock returns. Their study also highlighted the importance of financial ratios as tools to measure the financial health of a company.

To evaluate the success of a company in enhancing firm value, analysts often use financial performance measures as the main indicators (Katja, 2009). According to Benjalux (2006) performance measures are the fundamentals in determining a company's economic worth which is useful for investment decision-making. According to the Efficient Market Hypothesis, company stock prices reflect all of the fundamental factors about the company should the market is perfectly efficient (Fama, 1965). Based on the extent to which new information is reflected on stock prices, Fama (1965) suggests three market efficiency levels, namely weak-form, semi-strong-form, and strong-form efficiency levels. For weak efficiency levels, the current stock price reflects all the information provided by the relevant stock price time series. On a semi-strong efficiency level, stock prices can be explained by a time series of previous price variations and other publicly available information. The strongest efficiency level suggests that stock prices represent all publicly available information and all internally generated information including the company fundamental factors. In a perfect market, a company's stock price should rise if it performs well financially and fall if it performs poorly. However, in reality, markets are not perfectly efficient, and there is often a lag between a company's financial performance and its stock price. Despite this, stock prices do tend to reflect a company's financial performance over time.

The main objective of this research is to analyze a publicly listed transportation service company in Indonesia ASSA, within the context of the transportation service sector. This particular sector has not been extensively studied before, so this study aims to fill that gap. While drawing on previous research that examines the relationship between financial performance and stock returns, this study applies these findings to a different industry sector. There are five main financial ratios affecting a company's value or share price that are commonly measured: profitability, efficiency, liquidity, and solvency. Research conducted by Asmirantho & Somantri (2017) examines the effect of liquidity, solvency, profitability and market ratios on the stock price of a pharmaceutical company listed on the Indonesia Stock Exchange during the period 2012- 2016. The study incorporates Current Ratio (CR), Debt-to-Equity Ratio (DER), Total Assets Turnover (TATO), Return on Equity (ROE), and Earnings per Share (EPS) in the model as predictors of stock returns. Their research concludes that Current Ratio (CR), Debt-to-Equity Ratio (DER), Total Assets Turnover (TATO), Return on

Equity (ROE) lack the statistical significance to explain the variance in the stock price of the selected sub-pharmaceutical companies. Only Earnings per Share (EPS) has a significant impact on these sub-pharmaceutical companies stock prices. Another research by Halim, Sembel & Malau (2022) also reveals that ROA and ROE do not significantly influence stock returns. On the contrary, there are prior studies that found significant correlation between Return on Assets (ROA), return on equity (ROE), debt-to-asset ratio (DAR), debt-to-equity ratio (DER) and stock returns. They discovered that ROA and ROE have significantly positive effects on stock return, while debt-to-asset ratio (DAR) and debt-to-equity ratio (DER) are negatively associated with stock returns (Banerjee, 2019) (Endria, Dermawan, Abidin, & Riyanto, 2019) (Nurhakim, Yunita, & Iradianty, 2016) (Nurhikmawaty, Isnurhadi, Widiyanti, & Yuliani, 2020) (Riza & Sudiby, 2020) (Saleh, 2015) (Shakeel & Ali, 2018). Another industry sector explored by past studies is the property and real estate industry. The study analyzed the effect of financial performance and firm size on stock returns of property and real estate companies listed in the Indonesia Stock Exchange from 2012 to 2016 (Suciati, 2018). The results indicate that only leverage significantly affects stock returns, while liquidity, profitability, and firm size do not have a significant impact. These findings suggest that the relationship between financial performance and stock returns varies depending on the market environment in specific industry sectors. Therefore, the effects of each financial ratio on stock returns cannot be generalized across different industries. To provide more reliable information for investors in the transportation service capital market, this research deliberately focuses on the Indonesian transportation service company industry. The study aims to explore the potential connections between a company's fundamental financial factors and stock returns in this industry. Furthermore, there is limited research that examines the impact of these fundamental factors on stock returns in the context of an unprecedented financial phenomenon, such as the COVID-19 pandemic, which is reflected in the financial metrics from 2019 to 2021. The author of this study envisions that this research will serve as a valuable resource in the field of financial management, particularly for the advancement of sophisticated statistical models related to stock returns in the Indonesian transportation service industry.

2.1 Ratio Analysis

Ratio analysis in this study aims to analyze ASSA financial performance relative to BIRD (ASSA's closest competitor) and the transportation service company in Indonesia. The financial ratios included in the analysis are Return on Assets, Return on Equity, Asset Turnover, Debt Equity Ratios, Financial Leverage, and Current ratios.

Return on Equity (ROE) and Return on Asset (ROA) are profitability ratios most frequently used to predict stock prices or stock returns. According to Ristyawan (2019), the company's ability to generate profits for shareholders can be analyzed by interpreting its ROE. A company's efficiency in generating profits from shareholders' capital is reflected in a higher Return on Equity (ROE). Similarly, the ability of a company to generate profits using its assets is evaluated by the Return on Assets (ROA), which serves as a valuable measure of profitability.

Liquidity ratios are used to measure the company's ability to pay off short-term obligations at maturity and its operational activities (Hermanto & Agung, 2015). Halim, Sembel & Malau (2022) state that a high Quick Ratio indicates that the company is highly capable in financing its short-term obligations and more able to distribute dividends to investors, increasing the investors' confidence in their capital invested in the company. An

efficiency measure commonly used by analysts is asset turnover, which measures a company's efficiency in utilizing their assets base for revenue generation.

The debt-to-asset ratio (DAR) and debt-to-equity ratio (DER) are commonly employed financial ratios to determine a company's solvency and level of leverage. A higher proportion of debt in relation to assets indicates a greater financial risk undertaken by the company. Increased financial risk prompts investors to demand a higher return, thereby raising the company's overall cost of capital. As for a company's proportion of debt to equity, it indicates the extent to which the company can fulfill its obligations with capital as collateral (Kurniawan, 2021)

2.2 DuPont Analysis

The DuPont analysis is a framework for analyzing fundamental performance of a firm pioneered by the DuPont Corporation in 1920s. It is a useful technique used to deconstruct return on equity (ROE) for further investigate the main drivers of the company's profitability. As explained by Blumenthal (1998), the DuPont model helps to visualize financial information and is a helpful tool to gain a better understanding on how operating, financing, and investment decisions impact company financial performance (Melvin, Boehlje, Dobbins, & Gray, 2004)

The DuPont framework emphasizes three key financial factors that influence return on equity (ROE): operating efficiency, asset utilization efficiency, and financial leverage. Operating efficiency is determined by the net profit margin, which is the ratio of net income to total sales or revenue. Asset utilization efficiency is measured by the asset turnover ratio. Financial leverage is assessed by the equity multiplier, which is calculated as average assets divided by average equity, or often estimated based on the proportion of debt compared to equity.

2.3 Stock Return

Stock return is a measure of net profit (or loss) generated by the investments made by investors in the stock market (Amogha & Suresh, 2019). Fundamental analysis that investigates the main factors affecting stock return enables investors to examine the essential financial aspects for evaluating investment opportunities in the market (Shakeel & Ali, 2018). In other words, fundamental analysis allows investors to analyze the company's financial condition, future financial prospects and to predict movements of stock returns. For instance, higher financial performance is associated with higher stock prices in the stock market (Elliot & Schaub, 2006) (Breal, et al., 2022) (Tandelilin, 2010).

2.4 Hypothesis Development

Based on the literature review described above, the following hypotheses are proposed for this study:

H1: Leverage affect stock return of ASSA

H2: Liquidity affect stock return of ASSA

H3: Turnover positively affect stock return of ASSA

H4: Profitability positively affect stock return of ASSA

H5: Market return positively affect stock return of ASSA

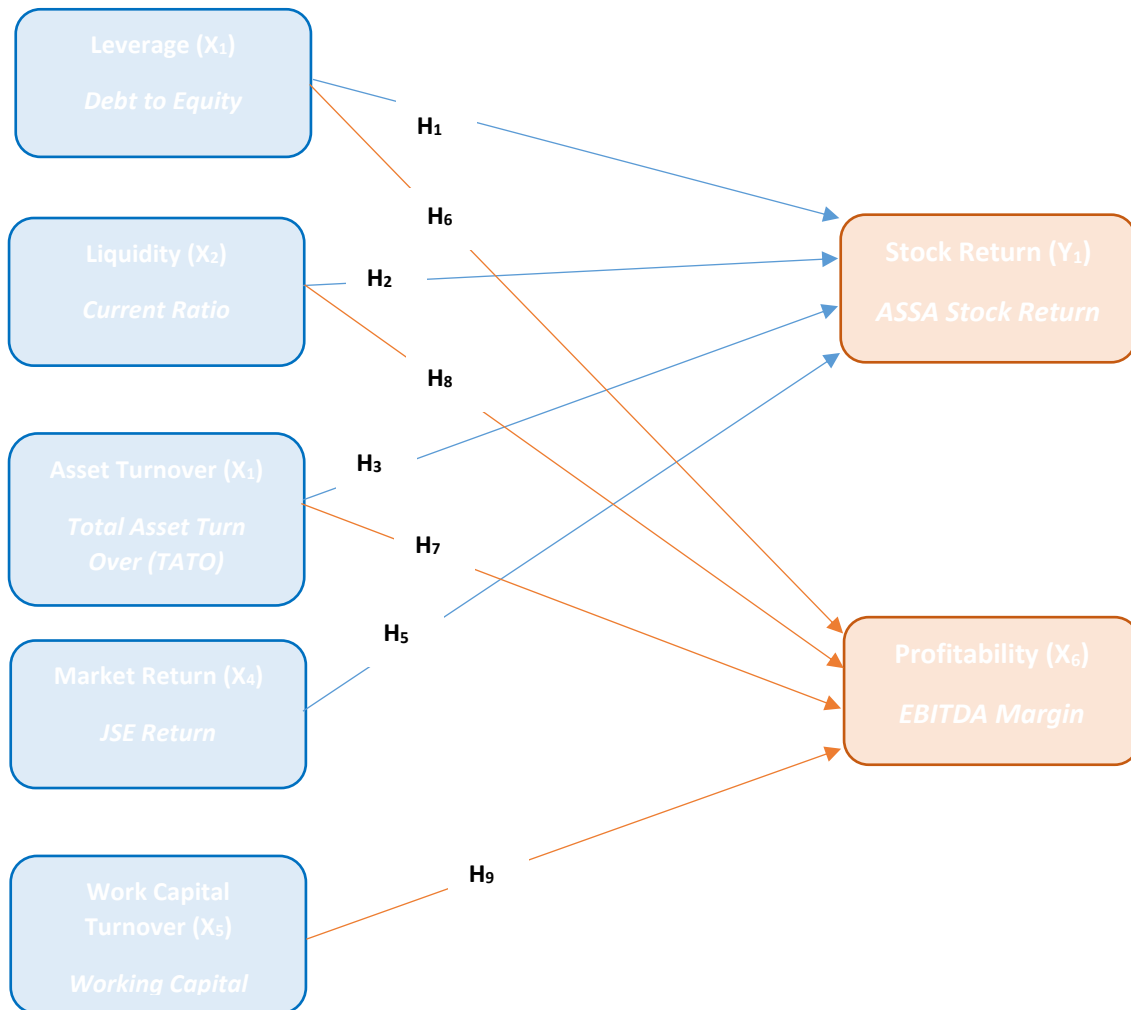

H6: Leverage affect profitability of ASSA

H7: Asset Turnover affect profitability of ASSA

H8: Liquidity positively affect profitability of ASSA

H9: Working capital turnover positively affect profitability of ASSA

Figure 1 – Research Hypotheses Framework

The Effect of Leverage on Stock Returns

Leverage refers to the methods of financing implemented by a company and to the level of financial risk the company is exposed to. Leverage is commonly measured by total debt to total assets ratio, debt to equity ratio, and the equity multiplier (Lenka, 2017). The profit effect of financial leverage, or equity multiplier, is to determine the extent to which additional resources can lead to an improvement of the company stock return (Vintila & Duca, 2012). Variance of stock returns is positively related to the firm's financial leverage (Aharon & Yagil, 2019). However, based on research by Abdullah (2013), there is a negative impact of Debt-to-Equity Ratio on Stock Return, in which the study concludes that highly leveraged firms are

more likely to have lower stock prices compared to low leveraged firms.

H1: Leverage affect stock return of ASSA

The Effect of Liquidity on Stock Return

The Current Ratio is used to measure liquidity, which represents a company's ability to fulfill its short-term financial obligations. A higher Current Ratio suggests that the company is well-equipped to meet its short-term obligations, while a lower ratio indicates the opposite (in severe cases, low liquidity may even lead to company bankruptcy).. Ulupui (2007) empirically shows that Current Ratios have positive and significant impacts on stock returns. However, an excessively high level of liquidity is also detrimental to the company as the company then owns a proportion of idle assets that do not earn the companies any profit nor improvement in firm value (Puspitaningtyas, 2017; Puspitaningtyas & Kurniawan, 2012).

H2: Liquidity affect stock return of ASSA

The Effect of Total Asset Turnover on Stock Returns

The operating performance of a firm can be examined by interpreting their asset turnover ratio. An efficiency ratio helps to evaluate whether the company has effectively maximized its assets to generate revenues (Vintila & Duca, 2012). Effective asset utilization measured by asset turnover metric is widely believed to be positively related to a firm's stock performance in the market, which is evident in the study conducted by Jabbari and Fathi (2014).

H3: Turnover positively affect stock return of ASSA

The Effect of Market Return on Stock Returns

There is a correlation between company stock returns and market returns, albeit to a certain extent. An upward trend in a company's stock returns tends to have a positive impact on the overall market return. However, this positive association is also contingent upon the returns achieved by other companies within the same market. Conversely, a positive market outlook (such as a bullish stock market) also has a favorable effect on the stock returns of companies operating within that specific market sector. As signified by Din (2017), market returns have statistically significant positive relationship with company stock returns.

H4: Market return positively affect stock return of ASSA

The Effect of Profitability on Stock Returns

Profitability indicates a company's ability to earn profit from the funds invested in the company assets (Puspitaningtyas, 2017). This measure of financial performance signifies how well the company in allocating their capital to earn the required rate of return (usually measured by profit margins or ROE). Sebnem and Vuran (2012) further found in their study that profitability is one of the main factors that significantly affect company stock returns.

H5: Profitability positively affect stock return of ASSA

The Effect of Leverage on Profitability

One of the ways to improve company profit is through financial leverage and utilizing debt as an instrument to improve company returns. A reasonable level of debt improves a company's ROE and profitability (Vintila & Duca, 2012). According to a study by Akhtar et al. (2012), companies in the fuel and energy sector may enhance their financial performance by improving their capital structure. Their study found that financial leverage will translate into profitability and value maximization in the long term particularly for fuel and energy companies.

H6: Leverage affect profitability of ASSA

The Effect of Liquidity on Profitability

Liquidity is often measured by current ratio as an indicator that measure the company's ability to service current liabilities with current assets. The higher the current ratio means the better the company's ability to pay off its short-term obligations, which also reflect less solvency risk or risk of inability to service short-term obligations borne by the firm (Puspitaningtyas, 2017). The ability of a company to remain liquid is positively correlated with firm's profitability as revealed by Ehiedu (2014). However, liquidity should be neither excessive nor inadequate. Excessive liquidity indicates accumulated idle funds, which do not earn any profit for the firm, and inadequate liquidity not only adversely affect the credit worthiness of the firm, but also interrupts the production process and hampers its earning capacity to a great extent. Hence, the need for efficient liquidity management is has always been crucial for corporates to run their business operations smoothly (Varshney, 2001).

H7: Liquidity affect profitability of ASSA

The Effect of Total Asset Turnover and Working Capital Turnover on Profitability

Numerous studies have explored the effects of asset turnover on a company's profitability. The total asset turnover ratio (TATO) is a metric that measures a company's ability in using its assets to generate revenues. Those assets include fixed assets (e.g. plant and equipment), inventory, accounts receivable, as well as any other current assets (Vintila & Duca, 2012). Okwuosa (2005) stated that the total asset turnover indicates the efficiency of an enterprise in managing total assets to generate maximum income. The higher the asset turnover, the more efficient the enterprise in utilizing assets for income generation. In addition, some studies also explore the effect of working capital turnover on company profitability. Mubiatingrum (2007) suggests that net working capital turnover significantly influences a company's return on assets; and the effect is positive.

3. METHODOLOGY

3.1 Data Collection

This research adopts a quantitative descriptive and inferential research method, with a purposive sampling technique to collect the required sample data. The transportation service company listed in IDX is selected as the population data. The sample data uses ASSA, a publicly listed transportation service company in Indonesia. First, this research will analyze ASSA financial performance by comparing ASSA financial performance position with its

closest competitor and the transportation service company by applying ratio analysis and the DuPont framework. To analyze ASSA relative financial performance, the research method uses quantitative inferential research method, with ASSA quarterly financial reports as the source of dataset. The same dataset will then be analyzed to determine the factors that affect profitability and ASSA stock returns in the market by using multiple regression statistical methods.

3.2 Sample Size

The sample examined consists of 40 quarterly financial reports of ASSA (from 2012 to 2021). These quarterly financial reports will then be compared against BIRD, which is also listed in IDX, as one of its closest competitors in the transportation service company sector; also compared with the industry average of transportation service company.

3.3 Variables of Study

Below are the list of variable study uses in this study.

Table 2 – List of Variables Study

$\text{Total Asset Turn Over} = \frac{\text{Net Sales}}{\text{Average Total Assets}}$	Indicator of total asset efficiency in generating revenues; representing cost advantage and competitive advantage in utilizing assets
$\text{Working Capital Turnover} = \frac{\text{Net Sales}}{\text{Average Working Capital}}$	Indicator of current liquid assets efficiency in generating revenues
$\text{Return on Assets} = \frac{\text{Net Income}}{\text{Average Total Assets}}$	Profitability indicator relative to its total assets
$\text{Return on Equity} = \frac{\text{Net Income}}{\text{Shareholders' Equity}}$	A measure of management effectiveness in utilizing company's assets to generate profits
$\text{Debt to Assets Ratio (\%)} = \frac{\text{Total Debt} \times 100\%}{\text{Total Assets}}$	Measurement of company's financial leverage

	<i>Total Assets</i>	
<i>Debt to Equity Ratio % =</i>	$\frac{\textit{Total Debt} \times 100\%}{\textit{Shareholders' Equity}}$	Measurement to indicate the relative proportion of debt to shareholders equity utilized to finance the assets of the company
<i>Current Ratio % =</i>	$\frac{\textit{Current Assets}}{\textit{Current Liabilities}}$	An indication of a company's ability to pay short-term obligations or those due within one year
<i>EBITDA =</i>	$\frac{\textit{EBITDA}}{\textit{Revenues}}$	A measure of firm's operating profit relative to its total revenues
<i>Stock Return =</i>	$\frac{P_t - P_{t-1} + D_t}{P_t}$	Indication of return of stock. Pt is the closing stock price at the period (i.e. period t) and Pt-1 is the stock price one period prior to period t, and Dt is dividend paid at period t.

3.4 Hypotheses Testing

Based on the research conceptual model provided in prior sections, the regression models of the research to answer the two problem statements are as follows:

- a. The first regression equation model to test factors that affect ASSA's stock return is:

$$Y_1 = \beta_0 + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3 + \beta_4 X_4 + \beta_5 X_5 + \epsilon$$

(Equation 1)

- b. The second regression equation model to test factors that affect profitability of ASSA:

$$Y_2 = \gamma_0 + \gamma_1 X_1 + \gamma_2 X_2 + \gamma_3 X_3 + \gamma_4 X_4 + \gamma_5 X_6 + \epsilon$$

(Equation 2)

With details of the variables as follows:

Y1: ASSA Stock Return as a dependent variable for the first regression equation

X1: Leverage (debt to equity ratio) as an independent variable for both Equation 1 and 2

X2: Liquidity (current ratios) as an independent variable for both Equation 1 and 2

X₃: Asset Turnover (total asset turnover ratio or TATO) as an independent variable for both Equation 1 and 2

X₄: Market Return (JSE stock return) as an independent variable for Equation 1

X₆: Working capital turnover as an independent variable for Equation 2

Y_{2or} X₅: Profitability Ratio (EBITDA Margin) as an independent variable to predict ASSA stock returns for the first regression equation (Equation 1) and as a dependent variable for the second regression equation (Equation 2) to predict profitability.

3.5 Tests for the Best Linear Unbiased Estimator (BLUE) Assumptions

The regression model must satisfy the Ordinary Least Squares (OLS) assumptions for the model to be valid in verifying the proposed hypothesis. Key OLS assumptions are the (1) variables linearity, (2) zero conditional mean (3) no multi-collinearity (4) homoskedasticity and no autocorrelation. Below are the steps performed to test any violations of the BLUE assumptions:

- Step 1. Run the regressions based on the proposed model using Microsoft Excel Data Analysis built-in statistical tools.
- Step 2. Test the regression models proposed whether the OLS assumptions are met.
- Step 3. Should one or more of the OLS assumptions be violated, the regression model will be revised.
- Step 4. The final revised model will be reassessed to ensure none of the OLS assumptions are violated
- Step 5. Analysis of the regression result to assess the proposed hypothesis.

After completing all the of the above BLUE Assumption tests, then the regression models are further analyzed by observing the **F-Test, T-Test, and P-Value** of the predictors in each model:

- If the p-value is lower than 0.05, the null hypothesis is rejected. This is a strong evidence that the null hypothesis is invalid and the alternative hypothesis is accepted.
- If the p-value is greater than 0.05, the null hypothesis cannot be rejected. This implies that there is no strong evidence to support the alternate hypothesis, and the effect proposed in the alternative hypothesis, hence, lacks statistical significance.

The tests for t-test, f-test and p value will be analyzed by the use of regression statistical tools in Microsoft Excel.

4. RESULTS, ANALYSIS AND DISCUSSION

4.1 ASSA Financial Performance Analysis

Table 3 – ASSA Income Trend from 2012 - 2021

	2021	2020	2019	2018	2017	2016	2015	2014	2013	2012
Revenue Growth	58%	-27%	-4%	11%	29%	-6%	-19%	1%	-12%	-7%
Net Income Growth	549%	-64%	-9%	-11%	57%	126%	-18%	-20%	-40%	-31%
EBIT growth	436%	-54%	-31%	-6%	62%	77%	-33%	-8%	-36%	-35%
Net Profit Margin	25.8%	6.3%	12.6%	13.2%	16.5%	13.5%	5.6%	5.5%	7.0%	10.3%

Despite the volatile income trend from 2012 to 2020, with a few negative income growths during the period, ASSA has recovered well in the most recent financial year. In 2021, ASSA experienced exponential positive growth in net income by 549%, as shown in table 3. The impact of drastic changes as a result of a global pandemic is optimistic for ASSA, which is evident in the drastic income growth in the last financial year. The significant variations in ASSA's income is most likely due to the fluctuations in the logistic and transportation service market for the past 10 year. The spike in logistic and transportation service price because of the pandemic also substantially contributed to the exponential revenue growth that ASSA experienced in 2021.

Table 4 – Summary of ASSA, BIRD and industry average financial ratios

	2021	2020	2019	2018	2017	2016	2015	2014	2013	2012	10-year Average
Return on Assets (ASSA)	14.7%	2.3%	6.1%	6.9%	8.0%	5.5%	2.4%	2.8%	3.4%	6.2%	5.8%
Return on Assets (BIRD)	1.8%	(2.9%)	0.1%	2.7%	11.8%	(5.2%)	(3.5%)	(1.3%)	(2.3%)	4.0%	0.5%
Return on Assets (Industry)	17.5%	2.3%	6.4%	14.0%	13.8%	3.8%	(6.7%)	1.7%	2.7%	7.0%	6.3%
Return on Equity (ASSA)	24.5%	4.0%	10.5%	11.4%	13.6%	9.5%	4.6%	5.7%	7.4%	14.1%	10.5%
Return on Equity (BIRD)	7.2%	(10.8%)	0.5%	8.7%	34.7%	(13.3%)	(8.8%)	(3.3%)	(5.4%)	9.3%	1.9%
Return on Equity (Industry)	20.4%	11.2%	11.0%	10.9%	16.6%	10.1%	(0.5%)	2.0%	15.0%	(42.8%)	4.1%
Current Ratio (ASSA)	2.08	1.51	1.71	1.96	2.56	2.47	2.40	1.64	1.77	1.57	1.97
Current Ratio (Industry)	2.00	1.69	1.50	1.51	1.62	1.67	1.64	1.49	2.06	2.38	1.75
Current Ratio (BIRD)	1.84	1.97	2.01	2.18	2.05	2.13	1.64	2.10	2.19	1.31	1.94
Debt to Equity (ASSA)	0.22	0.24	0.28	0.21	0.21	0.23	0.37	0.30	0.33	0.37	0.28
Debt to Equity (BIRD)	1.49	1.59	1.18	1.21	1.20	0.98	0.92	1.01	1.03	0.74	1.14
Debt to Equity (Industry)	0.27	0.39	(0.43)	(0.64)	0.19	1.23	1.98	1.11	0.88	6.19	1.12
Total Debt to Total Assets (ASSA)	0.22	0.24	0.28	0.21	0.21	0.23	0.37	0.30	0.33	0.37	0.28
Total Debt to Total Assets (BIRD)	0.36	0.39	0.34	0.37	0.37	0.40	0.36	0.40	0.42	0.32	0.37
Total Debt to Total Assets (Industry)	0.23	0.30	0.29	0.28	0.28	0.52	0.52	0.41	0.38	0.34	0.36
TATO (ASSA)	0.57	0.37	0.48	0.52	0.49	0.40	0.43	0.51	0.49	0.60	0.49
TATO (BIRD)	0.85	0.58	0.76	0.81	0.40	0.39	0.49	0.48	0.37	0.34	0.55
TATO (Industry)	0.85	0.58	0.72	0.86	0.67	0.51	0.55	0.64	0.70	0.71	0.68

Table 4 illustrates the key financial ratios that indicate ASSA relative financial performance and position over the 10-year-period from 2012 to 2021. From 2020 to 2021, the company ROE

and ROA grew significantly. In comparison to the transportation industry and its closest competitor (BIRD), although the ROA is slightly below the industry average in 2021, ASSA still outperformed its competitor by 12%. In the past 20 years, ASSA has maintained positive ROA and ROE, indicating that the management has efficiently managed the company asset base and investor's capital to generate returns for the capital providers. ASSA successfully achieved a 24.5% of ROE, outperforming both BIRD and the industry average in 2021. In terms of financial leverage, ASSA maintained a consistent proportion of debt financing as indicated by the stable debt-to-equity ratio over the past 10 years, at 0.51 on average. A relatively low proportion of debt implies that ASSA is financed more on equity, so that the company is less financially risky compared to the overall transportation service industry and its competitor. Furthermore, ASSA's current ratios are consistent in the range between 1.5 to 2 which shows that the company has no issues in servicing short-term obligations. Despite the satisfactory liquidity and profitability performance, ASSA's low asset turnover ratio (i.e. TATO) is concerning compared to its competitor and the transportation industry. Low asset turnover ratios suggest that the existing asset base is not managed efficiently to generate maximum revenues.

4.2 DuPont Analysis of ASSA Financial Performance

Return on equity (ROE) assesses whether the company can provide returns for shareholders (Asmiranto & Somantri, 2017). As highlighted by Halim, Sembel & Malau (2022), ROE examines the extent to which a company uses its resources to provide profits. The higher the ROE value of a company indicates that the company uses its resources (equity) well to generate maximum return. Return on equity of ASSA faced a remarkable growth over the last 10 financial years from 14.10 % to 24.46. In particular, ASSA's ROE improved substantially in 2021 by 20.5%. This surge in ROE may be supported by the improvement of both asset turnover ratios and net income in the most recent financial year. Deconstructing ASSA's ROE further by applying the DuPont Framework Analysis into three main aspects:

1. **Operating efficiency** – Operating efficiency is represented by the profit margin ratio (net income divided by total revenues). As shown in Table 3, ASSA profit margin grew significantly from 2020 to 2021 by almost three times (from 6.3% in 2020 to 25.8% in 2021). The increase can be explained by the increasing trend of overall revenues owing to the bullish logistic and transportation service market in the last financial year.
2. **Financial Leverage** - The debt-to-equity ratio is an indicator of financial leverage of a business. The higher the ratios of debt-to-equity, the greater the financial leverage and the risk of bankruptcy. The average of debt-to-equity ratios for the past ten years for ASSA is 0.51 times, and the most recent financial year at 0.37, lower compared to the prior year. From Table 3, it can be seen that ASSA is financed less on debt, as shown by the overall decreasing trend in debt-to-equity and debt-to asset ratios.
3. **Asset use efficiency** – Asset use efficiency is measured by the asset turnover ratio (i.e. TATO). Although the ratio is relatively low compared to the industry average and BIRD, ASSA improved its asset base efficiency from 2020 to 2021 which may contribute to the growth in 2021 ROE. Nonetheless, ASSA's TATO is still considered low (less than 1x), suggesting less efficient asset use in generating sales.

This is evident in ASSA most recent annual report that shows a decreasing trend of transportation production (Adi Sarana Armada, 2021) despite the bullish market for logistic and transportation service in 2020 and 2021. Other supply chain challenges such as unfavorable weather, labor and equipment supply constraint, outbreak of COVID-19, as well as transition of contractors that occurred during the year (Adi Sarana Armada, 2022), also faced by ASSA in 2021 that adversely affected ASSA's productivity and asset efficiency.

For this reason, it can be understood that the remarkable improvement in ROE is largely affected by a market factor which increases ASSA's total revenues and profit despite the inefficient asset use in production. The DuPont framework pinpoints the main drivers of ASSA's ROE, particularly in 2021. The analysis reveals that the exponential growth in 2021's ROE is least likely to be affected by a highly efficient asset utilization nor increase in financial leverage. The bullish logistic and transportation service market, increase in logistic and transportation service price, contribute largely to the improvement in ASSA's profit, and in turn, increases its ROE ratio. Nonetheless, the positive effect of increasing transportation price is partially offset by the reduction in transportation production by ASSA.

4.2 The Effects of Financial Performance on ASSA Stock Returns

This research uses a sample of 40 quarters (period 2012-2021) of ASSA financial reports. To understand the effect of ASSA financial performance on its stock returns, a multi regression analysis is performed using a combination of Microsoft Excel and R statistical tools. The proposed hypothesis incorporates multiple financial factors into the linear regression model to predict ASSA stock returns. As discussed in the previous section, the regression model must not violate any of the OLS Assumptions, hence, multiple tests are performed to select the most appropriate regression model in predicting ASSA share returns. Variables Linearity, heteroskedasticity, zero conditional mean, auto-correlation are tested using R statistical tools, to assess whether any of the key OLS assumptions are violated.

The first regression model as expressed in Equation 1 intends to predict stock returns of ASSA (dependent variable) with leverage, liquidity, turnover, market return, profitability as the independent variables. The hypothesis addressed by the first regression model are as follows:

H1: Leverage affect stock return of ASSA

H2: Liquidity affect stock return of ASSA

H3: Turnover positively affect stock return of ASSA

H4: Profitability positively affect stock return of ASSA

H5: Market return positively affect stock return of ASSA

After assessing the first linear regression model (Equation 1), the tests indicate that none of the OLS Assumption is violated. The residuals plot of the variables in the regression model satisfies the normality and zero conditional mean of OLS assumption. The Variance inflation factor (VIF), which measures the amount of multicollinearity in the multiple regression variables, for all predictors in the first regression model do not exceed 3 (the acceptable benchmark for level of multi-collinearity). Thus, the statistical test indicates that multi-collinearity is not present among the variables. The regression model also passed the auto-correlation test, in that the error terms in the regression model are independently and identically distributed. Hence, it is decided that the proposed regression model satisfies the key OLS Assumption.

1st Regression Model

$$Y_1 = -0.0164 - 0.0004X_1 + 0.0071X_2 - 0.0807X_3 + 0.0472X_4 + 0.3500X_5 + \varepsilon$$

Table 5 – Statistical summary of the first regression model

<i>Regression Statistics</i>				
Multiple R		0.3963

Total	39	0.01092262		

	<i>Coefficients</i>	<i>Standard Error</i>	<i>t Stat</i>	<i>P-value</i>
Intercept	-0.0164	0.0233	-0.7063	0.4848
Debt to Equity (X ₁)	-0.0004	0.0174	-0.0202	0.9840
Current Ratio (X ₂)	0.0071	0.0075	0.9540	0.3468
TATO (X ₃)	-0.0807	0.1623	-0.4975	0.6220
EBITDA Margin (X ₄)	0.0472	0.0409	1.1551	0.2561
Quarterly JKSE Return (X ₅)	0.3500	0.4188	0.8359	0.4091

The regression coefficients indicate the following relationships:

- There is a negative correlation between ASSA Stock Returns and the level of leverage, measured by the debt-to-equity ratio. With an increase in leverage, the stock returns are expected to decrease.
- There are positive correlations between ASSA Stock Returns and liquidity (measured by the Current Ratio), asset turnover (measured by TATO),

profitability (measured by EBITDA Margin), and market return (measured by JKSE Return). For each increase in these variables, the stock returns are expected to increase.

Based on the regression summary results, the value of determination coefficient or R- squared generated from the first regression model is relatively small ($R^2 = 0.1570$).

This indicates that only 15.7% of the variation in ASSA stock returns are explained by the variation in the independent variables (leverage, liquidity, asset turnover, profitability, market return). The remaining 85% of variance is explained by other variables not observed in the model, represented in the error term, ε .

The F value is 1.26682, which is relatively low suggesting that the joint effect of the variables on ASSA Stock returns is potentially not statistically significant. Furthermore, the p -values of each independent variable are higher than the 5% significance level threshold (0.05): 0.9840, 0.3468, 0.6220, 0.2561, 0.4091 for the leverage, liquidity, asset turnover, profitability, market return measures respectively. This implies that there is no strong evidence to support the proposed hypothesis ($H1$, $H2$, $H3$, $H4$, $H5$) as the null hypothesis fail to be rejected. Hence, at the 5% significance level, the result indicates that none of the variables have statistically significant effect on stock returns.

The findings of this study indicate that a significant portion of investors in the capital market do not take into account fundamental financial factors (leverage, liquidity, turnover, profitability) when making investment decisions. This suggests that the financial information available in the Indonesian capital market may not be particularly useful for investors, as these fundamental factors do not have a statistically significant impact on stock returns. Therefore, the efficiency of the Indonesian capital market in the transportation service sector can be characterized as semi-efficient. It is highly likely that stock prices are largely influenced by market sentiment, speculation, and macroeconomic factors. Furthermore, the minimal effect of these fundamental factors can also be explained by the less useful financial information due to accounting policies. According to Lev and Gu (2016), flaws in GAAP severely reduce the usefulness of financial reporting to investors or analysts in the market. The study also empirically shows that investors respond more strongly to non-GAAP (Generally Accepted Accounting Principles) earnings than GAAP Earnings. In other words, this study demonstrates how financial reports have largely lost their information relevance and ability to generate actionable investment alternatives for finance professionals. The lack of relevance and information content also explains why the majority of investors put more weight on market-generated factors rather than fundamental factors in making investment decisions.

4.3 The Effect of Financial Performance on ASSA Profitability

The second regression equation model (Equation 2) tests the statistical significance and the predictive influence of the selected financial factors on the level of profitability of ASSA. The profitability metric used in the model is EBITDA Margin rather than Return on

Equity, the common measure of profitability. Considering ASSA is an asset-intensive company that has a substantial amount of fixed assets, hence, significant amount of depreciation, EBITDA Margin is a more suitable profitability metric as the ratio factors out the effect of depreciation. The following group of hypotheses addressed by the second model are:

H6: Leverage affect profitability of ASSA

H7: Asset Turnover affect profitability of ASSA

H8: Liquidity positively affect profitability of ASSA

H9: Working capital turnover positively affect profitability of ASSA

Just like the OLS assumption tests conducted on the first regression model, it is also necessary to perform OLS assumption tests on the second regression model (Equation 2). The residuals plot of the variables in the second regression model meets the requirements of the normality assumption and the zero conditional mean assumption of OLS. Additionally, the Variance Inflation Factor (VIF), which assesses the presence of multicollinearity among the multiple regression variables, does not exceed the acceptable benchmark of 5 for any predictors in the second regression model. Therefore, the VIF test indicates that there is no significant multicollinearity among the variables in the second model. Furthermore, the regression model has successfully passed the autocorrelation test, indicating that the error terms in the regression model are independent and identically distributed. Consequently, the proposed regression model represented in Equation 2 satisfies the crucial OLS assumptions.

Second Regression Model

$$Y_2 = 0.0259 - 0.2166X_1 + 2.6943X_2 + 0.0610X_3 - 0.0365X_4 + \varepsilon$$

Table 5 – Statistical summary of the second regression model

<i>Regression Statistics</i>				
Multiple R		0.7606		
R Square		0.5785		
Adjusted R Square		0.5303		
Standard Error		0.0680		
Observations		40		

ANOVA				
	<i>df</i>	<i>SS</i>	<i>MS</i>	<i>F</i>
Regression	4	0.2223	0.0556	12.0092
Residual	35	0.1620	0.0046	
Total	39	0.3843		

	<i>Coefficients</i>	<i>Standard Error</i>	<i>t Stat</i>	<i>P-value</i>
--	---------------------	-----------------------	---------------	----------------

Intercept	0.0259	0.1226	0.2116	0.8337
Debt to Equity	-0.2166	0.0669	-3.2377	0.0026
TATO	2.6943	0.5938	4.5372	0.0001
Current Ratio	0.0610	0.0432	1.4122	0.1667
Working Capital				
Turnover	-0.0365	0.0536	-0.6796	0.5012

The regression coefficients and p-values suggest the following:

- The level of ASSA profitability is negatively related with the level of leverage as measured by the debt-to-equity ratio. Profitability is expected to decrease for every increase in the degree of financial leverage.
- The level of ASSA profitability is positively related with asset turnover as measured by TATO. Profitability (EBITDA Margin) is expected to increase by 0.027 for every one percentage point increase in TATO
- The level of ASSA profitability is positively related with liquidity as measured by Current Ratio. However, the effect is not statistically significant since the p-values is not below the significance level of 0.05. Hence, there is no strong statistical evidence to reject the null hypothesis.
- The level of ASSA profitability is positively related with working capital turnover. However, the effect is not statistically significant since the p-values is not below the significance level of 0.05. Hence, there is no strong statistical evidence to reject the null hypothesis.

Based on the regression summary results, the value of determination coefficient or R-squared generated from the second regression model is relatively high ($R^2 = 0.5785$). This indicates that 58% of the variations in ASSA's level of profitability (i.e., EBITDA Margin) is explained by the variations in the independent variables (asset turnover, liquidity, and working capital turnover). The remaining 42% of variance is explained by other variables not observed in the model, represented in the error term, ϵ .

The F value is 12.0092, which is significantly high, suggesting that the joint effect of the independent variables on ASSA profitability is statistically significant. Furthermore, the considerably low p -values of the TATO indicates that this financial metrics has positive statistically significant effect on profitability. The low p -values imply that the null hypothesis indicating that TATO has no impact on profitability can be strongly rejected, supporting the proposed hypothesis $H7$. The p -value for Debt to Equity is also significantly below 0.05 that suggests a statistically significant effect on ASSA profitability. In contrast, working capital ratio and liquidity appear to lack statistical significance in predicting ASSA level of profitability as its p -values is clearly larger than 0.05. Hence, at the 5% significance level, the result indicates that only leverage and total asset turnover have statistically significant effect on profitability.

The regression analysis highlights that asset turnover has significant positive relations with profitability. Total asset turnover (TATO), an indicator of asset efficiency in generating sales, measures how well the company in utilizing its asset base. A company asset base mainly consists of current assets (cash, trade receivables, inventory, and advance payments) and fixed assets. According to Munawar's study (2019), the high amount of productive assets, both current and fixed asset components, will improve sales and positively affect profitability. This is consistent with the result of this study in analyzing the effect of asset turnover on profitability. In addition, according to several studies, improvement in liquidity contributes to an increase in the level of company profitability. Indeed, adequate liquidity levels support the company to reduce exposure to financial crises and liquidity risk (Waleed, Pasha, & Akhtar, 2016). Nevertheless, having an excessive amount of liquid assets can also negatively impact profit levels, as it suggests that the company is not effectively utilizing its current assets to optimize profitability. It is important for companies to strike a balance and maintain an appropriate level of liquidity to ensure sustainable growth in profitability. While there may be a potential positive association between liquidity and profitability, it may not have statistical significance in explaining the variations in a firm's profitability.

On the other hand, the regression analysis reveals a significant negative link between financial leverage and profitability. Financial leverage addresses a company's level of financial risk exposure. An increase in leverage then corresponds with an increased exposure to risk and higher short-term expenses. As suggested by a study (Ulzanah & Murtaqi, 2015), a higher debt proportion relative to the company's equity represents a higher financial risk, increasing the interest on debt financing. A higher cost of capital would then result in the reduction in profits.

5. CONCLUSIONS AND RECOMMENDATIONS

5.1 Conclusions

Based on the comparative analysis of ASSA's financial performance, this study concludes that the company has performed relatively well financially, especially in earning positive returns and maintaining a moderate level of liquidity. These are evident in the growing profitability ratios and stable proportion of debts over the last ten financial years. Nonetheless, the concerning low asset turnover ratios suggest that ASSA management has failed to efficiently utilize their existing capital to generate maximum revenues. The DuPont ratio analysis allows the researcher to determine whether the three fundamental factors (operating efficiency, asset-use efficiency, and financial leverage) are the actual key drivers of ASSA's positive returns. The analysis shows that the rise in logistic and transportation service prices as result of a macroeconomic shock (i.e., COVID-19 pandemic) is the primary explanation for ASSA's improvement of profitability. The decline in transportation production, asset-use efficiency and financial leverage are not the factors improving the company's returns.

Regarding the financial determinants of an Indonesian logistic & transportation service company stock returns, the regression analysis reveals that none of the fundamental financial factors have statistically significant impacts in predicting ASSA stock returns. The low R-squared value of the model indicates that ASSA stock return is most likely affected by

other unobserved factors, price fluctuations of transportation in the market being one of the examples. Nonetheless, it is out of the scope of this study to examine the effects of external market-generated metrics as this study focuses on the impact of a firm's fundamental financials on company stock returns. The results in this study also explain the semi-efficiency of the Indonesian capital market, particularly in the transportation service company sector. No fundamental factors having significant impact on ASSA stock returns imply how the majority of the investors in the market do not rely on fundamental financial factors in making investment decisions.

It can also be inferred from the second regression analysis that improvement in the company's financial performance, specifically the company asset turnover, is positively linked with improvement in profitability. On the contrary, financial leverage has an inverse relationship with company profitability, suggesting that a company should maintain and closely monitor its exposure to financial risk caused by financial leverage, to sustain a positive profitability trend. In other words, firms should maintain an optimal balance of leverage that does not threaten their going concern status yet allows them to earn adequate returns from relying on debt financing.

In conclusion, the results from the ratio analysis and regression models are consistent. Both analyses reveal that stock returns and a company's value on the logistic and transportation service sector is largely affected by external shocks, and that, investors in this sector relies less on fundamental factors, and more on market-generated information.

5.2 Recommendations

For analyzing transportation service company stock returns, investors should include the effects of external market factors (e.g., demand and supply trend in the industry sector, macroeconomic factors, political climate, logistic and transportation service price fluctuations) in addition to the company's financial performance. A market-oriented approach to assessing company stock returns is favored, partly due to concerns regarding the limited relevance of reported accounting information. Lev and Gu (2016) stated that the usefulness of financial information has rapidly dissipated between 2003 and 2013 as more and more companies rely on non-GAAP earnings information. Therefore, investors should strive to be more resourceful in collecting accurate and relevant information, encompassing both financial and non-financial data from both internal and market sources. By doing so, they can make informed investment decisions that are grounded in the most reasonable and comprehensive understanding of the market.

The regression analysis revealed that variations in Total Asset Turnover (TATO) have the most substantial and statistically significant impact on ASSA's profitability. This finding indicates that companies, particularly those operating in asset-intensive industries such as transportation services, should prioritize enhancing their asset and cost efficiency in order to improve profitability. Asset-intensive firms normally invest heavily in the entire value chain to capture any growth opportunities; thus, strengthening their positions in the value chains will enhance their asset base efficiency and product quality, which ultimately improve overall

profitability (Praptana & Hermanto, 2016). Leverage is also another significant determinant of ASSA profitability. A company's ability to control its financial risk is therefore also a priority in improving profit metrics.

5.3 Theoretical Implications

This study contributes valuable insights to the existing knowledge of financial performance analysis and the competitive position of companies in the market. The results shed light on the key drivers of stock returns and profitability specifically within the transportation service company industry in Indonesia. Previous studies have suggested that factors such as liquidity, leverage, asset efficiency, and profitability can influence stock returns, either positively or negatively. However, this study reveals that none of these factors have a significant impact on stock returns in the transportation service company sector. It suggests that external factors, such as macroeconomic shocks that alter market demand and supply trends, play a more crucial role in stock price fluctuations compared to a firm's financial fundamentals. Other studies have also indicated that similar factors, such as leverage and asset turnover, affect company profitability. The findings of this study align with prior research conducted in different industry sectors regarding the effects of fundamental factors on profitability. In the second regression analysis, the study identifies a significant positive relationship between asset turnover and profitability in transportation service companies, while the degree of leverage is marginally negatively associated with firm profitability.

5.4 Practical Implications

The study findings have underscored important insights for stakeholders and investors regarding investment decision-making and financial performance in the Indonesian transportation service company industry. It is crucial to adopt a comprehensive analysis approach that considers both internal and market factors when evaluating a company's financial performance, particularly for firms operating in volatile markets such as logistics and transportation services. Analyzing macroeconomic factors and fundamental factors is essential for strategically assessing the financial performance of logistic and transportation service companies. Moreover, a deeper understanding of the market dynamics and the company's fundamental factors will facilitate the development of advanced economic models for predicting company financial performance within the specific market context. This enhancement in the model would prove highly beneficial for two main purposes: (1) assisting stakeholders in their investment decision-making process and (2) guiding the company's management in identifying key areas of focus that contribute to enhancing overall firm value. It is crucial to consider external factors, such as the political climate, economic fluctuations, and trends in interest rates and inflation, in conjunction with financial performance when making investment decisions. Regarding the findings from the analysis of ASSA's financial performance, it is recommended to innovate and implement more efficient approaches in utilizing company resources for transportation production, which constitutes a significant revenue source. By successfully improving transportation production and optimizing asset

utilization, ASSA can potentially experience higher profitability and positive returns in the bullish logistic and transportation service market, assuming the company maintains a stable capital structure.

6. LIMITATIONS

The findings of the multiple linear regression analysis indicate that the predictive power of financial performance in forecasting company stock returns and profitability within the transportation service industry is still limited. It is important to acknowledge that there are other unobserved variables that may have a significant impact on a company's profitability and stock prices in the market, such as fluctuations in transportation prices and macroeconomic factors. Future research can delve deeper into examining how these external factors influence company stock prices and profitability. By incorporating both financial performance, as explored in this study, and key external market factors, the statistical model can potentially improve its ability to explain variations in company stock returns and profitability. However, it is important to recognize that there is no perfect statistical model that can accurately predict share prices and company profitability with absolute certainty, as companies operate in a volatile and dynamic market environment.

ABSTRACT

Private Equity (PE) has grown significantly over the last few decades. PE invests in companies with growth potential to increase their value over time. Several studies show that large PE companies are quite hesitant to invest in Indonesia. Despite the political and regulatory challenges, most companies controlled by families or local conglomerates still need to be more explained about the impact of PE on their business and are more likely unwilling to share ownership with other investors. Therefore, this study examines how PE investment affects companies listed on the Indonesia Stock Exchange. The variables used are liquidity, leverage, profitability, sales growth, stock returns, and company size as control variables. The sample consists of 600 quarterly financial data from 15 PE-backed companies and 15 non-PE-backed companies from 5 years after the IPO or after PE's investment, whichever is the most recent. This study uses quantitative research methods and purposive sampling with significant tests method. Research findings show that PE positively and significantly affects liquidity, profitability, and sales growth. This study supports the theory of Principal Agents and the Efficient Market Hypothesis. For practical implication, investors may view PE investments as an indicator of good portfolio performance, while entrepreneurs may view them as a funding option that improves company performance.

Keywords: Liquidity, Leverage, Profitability, Sales Growth, Stock Return

INTRODUCTION

At the moment, the majority of investors sell their assets on the open market. Only 24% of investors' investment allocation is given to options other than the public market, and of that 24%, only 18% engage in private equity, according to research done by EY for the 2019 Global Private Equity Survey. This suggests that private equity has significant room for expansion, as seen in Figure 1.

Figure 1. Investors' Asset Allocation Alternatives

Source: 2019 Global Private Equity Survey by EY

Private equity may be defined as the investment of equity capital in privately held businesses. An investor buys an interest in a private firm in a conventional private equity transaction with the expectation that the stake's value would increase over time. These funds look for businesses with mathematical growth and capital limitations and provide the tools and expertise necessary for their exponential growth.

Private equity has its roots in the US and has aided the expansion of several multinational corporations, including Google, Microsoft, Apple, Amazon, Federal Express, and others. Since private equity funds are created to lower the risks connected with the firms they participate in, they are a possible replacement for traditional funding. In addition to providing financial support, PE can help invested companies improve their operations and management skills, boost their reputation, and optimize their corporate governance structures, all of which can have positive external effects that encourage their quick growth and successful listing (Xin and Xiumin, 2019)

1. BACKGROUND

Over the past two decades, the private equity sector has grown dramatically, and academic research has become more and more focused on its effects. Following an already lucrative year in 2020, private capital investment in Southeast Asia more than quadrupled to a record \$21.5 billion in 2021. Investments in the transportation, payments, and healthcare sectors drove an 86% yearly increase in the amount of money spent on PE deals.

Note: The 2018 total includes a USD12.1b investment in Global Logistics Properties and a USD2b first tranche of Grab's Series H.

Figure 2. Southeast Asia Private Capital Investment

Source: 2022 Southeast Asia Data Insight by GPCA

Indonesia has developed into one of the most alluring Asian and Emerging markets, according to a Probitas Partners assessment of institutional investors in private equity for 2022. However, there are comparatively fewer who choose Indonesia as a targeted country when compared to other Asian markets, namely Vietnam and other Southeast Asian nations. As part of the most attractive Asian markets and most attractive emerging markets, Indonesia was not in an increasing rank trend from 2016 to 2022, which is different from Vietnam and other Southeast Asian countries that have an inclining trend, especially Vietnam. It is based on data from the Probitas Partners Survey from 2016 to 2022.

A 2012 Wall Street Journal investigation found that Indonesia was still too risky for investors without the right connections and knowledge due to Indonesia's lengthy history of corruption and convoluted legal processes. In addition, it is difficult to reliably make sizable investments due to Indonesia's complicated regulatory system.

Another aspect limiting the key players is the size of a transaction. Analysts claim that while private equity firms like KKR like to invest more than \$500 million in acquisitions, they actually find smaller investments in Asia. Given that the majority of the biggest companies in the nation are owned by local conglomerates or the government, there is no question that a sizable chunk of the Indonesian economy needs more funding. While most families that hold the largest companies in the nation do not require outside money, are unwilling to relinquish ownership, or are just oblivious to the influence of private equity on the company's profitability, privatizations are routinely postponed and occasionally complicated by political disputes.

Due to Indonesia's complex regulatory environment, history of corruption, and the fact that the majority of the nation's largest businesses are run by family-run conglomerates, more investors are willing to give it a try despite the country's significant challenges in attracting investments and concluding deals. The private equity companies embraced aggressive growth tactics, especially in developing countries. However, by enacting various legal measures to boost the investment landscape, the Indonesian government has greatly improved the Indonesia's investment ecosystem in recent years. The Indonesian government is devoted to offering domestic and global investors that wish to invest in Indonesia assurance and security.

Studying the literature review reveals that academics have created a framework for their research that is quite established, especially when it comes to the impact of private equity on businesses. There is growing evidence from recent scholarly studies that private equity investors have beaten reasonable standards. According to some study, the financial effects of PE investments are roughly the same. Research has also been done on the effect of private equity on stock performance. While there are certain firms that were already publicly listed before private equity participated in the company, the majority of research papers focus on the influence of private equity on the success of initial public offerings (IPO) or after the IPO. With thorough research on the effects of PE investments on a mix of both financial success and stock performance, this study seeks to close the found gap. Due to the fact that PE investment in Indonesia is still relatively young, it has also been noted that very little study has been done on Indonesian businesses. As a result, we know very little about how PE investments affect Indonesian businesses.

Efficient market hypotheses and principal-agent theory served as the study's guiding theoretical frameworks. According to the Principal-Agent Theory, it might be challenging for the principal (shareholders) to ensure that the agent (management) makes the best decisions. It is crucial for PE investment experts to get trustworthy data since the information they gather

serves as the basis for investment decisions. PE companies act as a middleman between capital sources (principals) and corporate entrepreneurs (agents).

Numerous private equity firms advertise to their potential portfolio companies and investors their capacity to enhance value through improved operational performance. According to a summary of following studies by Kaplan and Strömberg (2009), PE investments are often linked to increases in operating performance or productivity. When it came to reflecting information about individual stocks and the stock market, the securities markets were incredibly efficient, according to the Efficient Market Hypotheses. The widely held belief was that when new information emerges, it travels swiftly and is immediately included into the values of assets. This thesis will provide a conceptual explanation of how stock performance reflects what investors expect from the firm. Based on the aforementioned research gap, investors also have expectations of the firms, which are reflected in the performance of their stock. But additional research is required to fully understand how PE investments affect both stock performance and monetary results. The second goal of the study is to examine how stock performance and PE investment have an influence on investor expectations.

2. LITERATURE REVIEW

2.1 Principal-Agent Theory

The generic principal-agent relationship is common in a variety of commercial and everyday contexts. In general, an agency relationship exists when the activities of one individual, the principal, are dependent on those of others, the agent (Mehta, 2004). Shareholders are the principals; firm management is the agents. The principal-agent paradigm's two primary informational concerns are hidden information, also known as asymmetric information, and hidden action, also known as moral hazard (Pratt and Zeckhauser 1985). Most PE investments now use an organizational structure called a limited partnership to get around the challenges of secret information and covert activity. On the one hand, these private equity partnerships' managers have the time and know-how to choose assets carefully and oversee start-up funds after an investment. Each investor conducting such time-consuming monitoring and due diligence would undoubtedly be wasteful. As a result, it is usually more practicable to only give seasoned private equity fund managers the responsibility of contracting and monitoring (Gompers and Lerner, 1999).

2.2 Efficient Market Hypotheses

The efficient market hypothesis (EMH) is still an important part of modern finance. Although the actual data is unclear, the theory is valid. The EMH is applicable to capital markets. A stock market that is efficient in general is one in which stock prices reflect basic business information (Degutis & Novickyte, 2014). The company's market worth differs in this case. Given the above knowledge, it becomes increasingly difficult to earn an excessive return on the stock market. If the market is moderately efficient, technical analysis will not provide a return advantage. In semi-strongly efficient markets, current stock prices reflect not just historical prices but also all publicly accessible information, such as acquisition announcements, dividend distributions, and changes in accounting standards, among other things. In highly efficient markets, current stock prices indicate all conceivable information that does not need to be released. This sort of market efficiency implies that profiting from insider information is impossible, which looks improbable (Malkiel, 2011).

2.3 Private Equity Investment

The capital structure of a firm is the mix of debt and equity used to fund its investing activities. Several factors influence the decision between debt and equity. The assessment of

capital structure is critical because the financing alternatives that form capital structure have an influence on profitability, business value, the cost of capital, and investment decisions (Hardiyanto et al., 2015), PE investments are one type of capital structure.

There are three related literary collections. The first group studies if and how private equity funds contribute value to businesses; the second set looks at the financial success of PE-backed firms following their initial public offerings; and the third set looks at PE ownership of businesses following their IPO (Suhail and Echavarría, 2019). According to Gompers and Lerner (2001), understanding the private equity market necessitates familiarity with the full risk cycle, which is divided into four stages: capital acquisition, investment, monitoring, and output. The cycle starts with a risk fund analysis, then progresses to prospection and proposal selection based on project analysis. Whether or whether the expected goals are achieved is determined during the monitoring phase; shared management also adds value.

2.4 Company Performance

According to Bhunia et al. (2011) the practice of evaluating a company's operating and financial aspects based on its accounting and financial statements is known as financial performance analysis. The goal of this study is to examine the firm's management's efficacy and performance using financial data and reports. The analyst seeks to assess the firm's liquidity, profitability, and other indications that the business is run sensibly and properly, guaranteeing sufficient returns to shareholders to keep the firm's market value at a minimum.

A performance that is equally significant to financial performance is stock performance. Investing in the stock market is frequently done by investors seeking dividends, capital gains, or firm ownership as a kind of return. Prior to making an investment, investors will think about the company's valuation and the acceptable stock return. When assessing an investment's success, the actual return is crucial (Wijaya et al., 2020). The market worth of the companies is reflected in the stock price. A greater stock price results from a higher stock value (Husnan, 2012). Types of return that are expected mainly by investors are capital gains and dividends (Suhadak et al., 2019). The price of stocks is influenced by supply and demand. These factors are influenced by irrational variables in addition to rational and irrational variables.

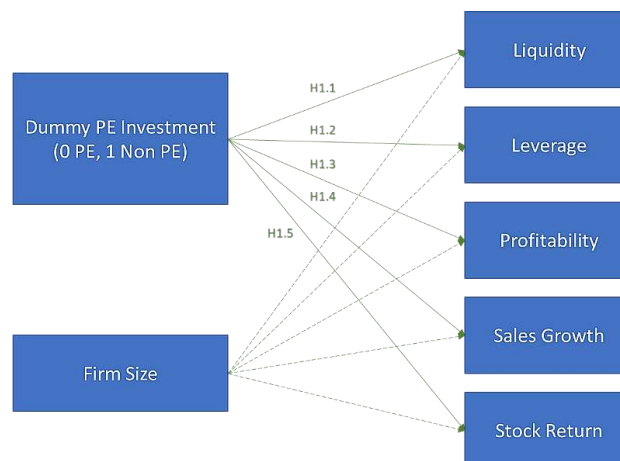

Figure 3. Research Framework

The assumptions in this investigation are depicted in Figure 3:

- H_{1.1}: Investment Private Equity has a positive effect on liquidity
- H_{1.2}: Investment Private Equity has a negative effect on the level of leverage
- H_{1.3}: Investment Private Equity has a positive effect on profitability

H_{1.4}: Investment Private Equity has a positive effect on sales growth

H_{1.5}: Investment Private Equity has a positive effect on stock return

3. RESEARCH METHODS

As for the research framework for analyzing the impact of PE investment on company performance, this study uses four measures based on company financial policies (Cronqvist et al., 2009): liquidity, leverage, profitability, sales growth, and combining with stock returns, with firm size as control variables. A control variable in research investigations is anything that is maintained steady or constrained. It is a variable that has no bearing on the study's goals but is controlled anyway since it might have an impact on the findings. Research biases like the bias of an omitted variable can be avoided with the use of control variables. Purposive sampling is used to obtain data as part of the quantitative descriptive research methodology. A non-probability sampling method called "purposeful sampling" selects units based on their possession of desired qualities.

On the Indonesia Stock Exchange as of September 2022, there are roughly 810 firms listed. These businesses are the population in this research. For this study, it has also been checked to see whether any private equity has been invested in each of the firms using the internet news and investor database (www.crunchbase.com). Roscoe (1975) advises on how to figure out the sample size. He says that the sample size for each study should be between 30 and 500 people, with at least 30 people in each part of the sample. Therefore, 30 companies were picked as our sample. The techniques of data analysis could be explained using panel data regression analysis.

4. RESULTS AND DISCUSSION

The classical assumption test is conducted first before undertaking panel data regression analysis to confirm that the parameter values for testing are legitimate. Normality, multicollinearity, heteroscedasticity, and autocorrelation tests are examples of classical assumption tests that must be satisfied in order to test this technique (Ghozali, 2013). A common assumption test in research is the one that follows.

4.1 Normality Test

The distribution of the regression model is examined for normality using the data normality test. Jarque-Bera - Normality Test was employed in this work as the data normality test. Table 1 displays the results of the normality test:

Table 1. Normality Test Result

	<i>Jarque-Bera</i>	<i>Nilai Probabilitas</i>
Liquidity	4.128158	0.126935
Leverage	4.770388	0.092071
Profitability	2.681170	0.261693
Sales Growth	5.598653	0.060851
Stock Return	4.041516	0.132555

Source: Results of Data Processing with Eviews 10 (2023)

The Jarque-Bera normality test is used as the foundation for decision-making, and the significance threshold is set at 0.05. If the significance value is more than 0.05, the study data is normally distributed/data dispersed. According to Table 1, the probability value of each

regression model is more than the significant threshold of 0.05, implying that the data in this research model are normally distributed.

4.2 Panel Data Regression Model

4.2.1 Hausman test

For the Hausman test, the following is the hypothesis:

H₀: *Random Effect Model (REM)*

H₁: *Fixed Effect Model*

Alpha = 5%

Conditions: Reject H₀ if the p-value < alpha.

Results from the Hausman test performed with the EViews 10 program are reported in

Table 2:

	Alpha	Cross-Section Random (Prob.)	Estimasi Model
Liquidity	> 0,05	0.2287	<i>Random Effect Model</i>
Leverage	> 0,05	0.0003	<i>Fixed Effect Model</i>
Profitability	> 0,05	0.3851	<i>Random Effect Model</i>
Sales Growth	> 0,05	0.8174	<i>Random Effect Model</i>
Stock Return	> 0,05	0.8386	<i>Random Effect Model</i>

Source: Results of Data Processing with Eviews 10 (2023)

According to Table 2, the probability value in the random variable cross-section test of the liquidity variable is 0.2287, which suggests it has significance above the 95% level of significance (= 5%). In other words, the model employs the random effect model approach. Therefore, the probability value in the random cross-section test of the leverage variable is 0.0003, which indicates that it has substantially less importance than the 95% threshold (i.e., 5%). In other words, the model employs the fixed effect model approach. The probability value in the random cross-section test of the profitability variable is 0.3851, which indicates that it has a significance higher than the 95% threshold of significance (= 5%). To put it another way, the model applies the random effect model approach.

Additionally, the sales growth variable's probability value in the random cross-section test is 0.8174, which indicates that it has significance above the 95% level of significance (= 5%). To put it another way, the model applies the random effect model approach. The probability value for the stock return variable in the random cross-section test is 0.8386, which indicates that it has significance above the 95% level of significance (= 5%). To put it another way, the model applies the random effect model approach.

4.2.2 Lagrange Multiplier Test

Between the Pooled Least Square (PLS) and Random Effect Model (REM) methods, this test is used to identify the model. For the LM test, the following is the null hypothesis:

H₀: *Common Effect Model (PLS)*

H₁: *Random Effect Model (REM)*

Alpha: 5%

Conditions: Reject H₀ if Prob. Chi-Square < alpha 0.05.

The results of the Lagrange Multiplier Test performed using the EViews 10 Software are reported in Table 3:

Table 3. Results of the Lagrange Multiplier Test

	Alpha	Prob. Chi-Square(2)	Estimasi Model
Liquidity	< 0,05	0.0000	<i>Random Effect Model</i>
Leverage	< 0,05	0.0000	<i>Random Effect Model</i>
Profitability	< 0,05	0.0000	<i>Random Effect Model</i>
Sales Growth	< 0,05	0.0000	<i>Random Effect Model</i>
Stock Return	< 0,05	0.6717	<i>Common Effect Model</i>

Source: Results of Data Processing with Eviews 10 (2023)

The Prob. Chi-Square variable liquidity of 0.0000 is less than alpha 0.05, according to the findings of the LM test. The random effect model is thus followed by the model estimation technique. The Prob value is then acquired. The alpha is 0.05 and the chi-Square variable leverage is 0.0000. This indicates that the random effect model is followed by the model estimation technique. Because it is possible to calculate a Prob value for the variable profitability. Alpha 0.05 is less than the Chi-Square of 0.0000. Thus, the random effect model is followed by the model estimation technique.

The value of Prob. Chi-Square variable sales growth of 0.0000 is less than alpha 0.05, according to the findings of the LM test. The random effect model is thus followed by the model estimation technique. Last but not least, the Prob. Chi-Square variable stock return of 0.6717 is larger than alpha 0.05, as determined by the results of the LM test. This indicates that the common effect model is followed by the model estimation technique.

4.3 Best Model Selection Recommendations

Table 4. Panel Data Regression Model Selection Results

	Hausman Test	Lagrange Multiplier Test
Liquidity	<i>Random Effect Model</i>	<i>Random Effect model</i>
Leverage	<i>Fixed Effect Model</i>	<i>Random Effect Model</i>
Profitability	<i>Random Effect Model</i>	<i>Random Effect Model</i>
Sales Growth	<i>Random Effect Model</i>	<i>Random Effect Model</i>
Stock Return	<i>Random Effect Model</i>	<i>Common Effect Model</i>

The findings of the Lagrange multiplier test and the Hausman test on the liquidity variable are identical. The random effect model is shown to be the best choice for affecting liquidity at that point. Additionally, the findings of using a panel data regression model for affecting leverage are inconsistent. It is then found that the optimal model for affecting leverage employs a random effect model after looking at the outcomes of the fixed effect model using a singular matrix. The findings of using the panel data regression model to determine how profitability is influenced are same. The random effect model is then used to identify the optimal model for impacting profitability.

The findings of the Lagrange multiplier test or the Hausman test then yielded identical results. Thus, using the random effect model, the optimal model for affecting sales growth is chosen. Last but not least, Table 4's panel data regression model findings for stock return demonstrate a variety of outcomes. The greatest r-squared value is used to identify the best

model for affecting stock returns; the random effect model has a higher r-squared value than the common effect model.

4.4 Partial Regression Coefficient Test (t-test)

The estimation results for each model are presented in Table 5:

Table 5. Hypothesis Testing Results

	Coefficient	Std. Error	t-Statistic	Prob.
PE → LIQ	0.631552	0.167418	3.772312	0.0001
PE → LEV	-0.039776	0.048500	-0.820124	0.2063
PE → PROF	0.010271	0.004147	2.477049	0.0069
PE → SG	0.032789	0.016872	1.943440	0.0263
PE → SR	0.000538	0.014577	0.036914	0.9706

Source: Results of Data Processing with Eviews 10 (2023)

It may be deduced from the partial hypothesis testing (t-test) findings in the preceding table that:

1. Effect of PE Investment on Liquidity

β (beta) a positive direction of 0.631552 and a significant value of 0.0001 (5% significance threshold) are found. As a result, it is possible to conclude that PE investment has a beneficial influence on liquidity.

2. Effect of PE Investment on Leverage

β (beta) -0.039776 in the negative direction and a significance threshold of 5%, or 0.2063, are used to arrive at the value. As a result, it is evident that PE investment has no impact on leverage.

3. Effect of PE Investment on Profitability

Attained a β (beta) value with a positive direction of 0.010271 and a significance level of 5% of 0.0069. The impact of PE investment on profitability can thus be seen as favorable.

4. Effect of PE Investment on Sales Growth

A significance threshold of 5% was used to calculate the β (beta) value, which was achieved in the positive direction at 0.032789. As a result, it is evident that PE investment contributes to the rise of sales.

5. Effect of PE Investment on Stock Return

In accordance with the findings of the hypothesis, a β (beta) value is produced with a positive direction of 0.000538 and a significance value of 0.9706 (5% significance threshold). It follows that PE investment has little impact on stock performance.

4.5 Determination Coefficient Test

The percentage of the dependent variable's overall variance that is explained collectively is expressed by the coefficient of determination test (R^2). R^2 measures the goodness-of-fit, or how well the sample regression line resembles the actual data.

Table 6. Test Results for the Coefficient of Determination (R^2)

	R-Squared
Liquidity	0.0982 (9,82%)
Leverage	0.0148 (1,48%)
Profitability	0.1760 (17,60%)

Sales Growth	0.0119 (1,19%)
Stock Return	0.0074 (0,74%)

Source: Results of Data Processing with Eviews version 10 (2023)

According to the study's findings, which are presented in Table 6, the coefficient of determination of liquidity is 0.098294, meaning that PE investment has a 9.82% impact on liquidity. PE investment has a further effect of 0.0148 or 1.48% on the coefficient of determination of leverage. Profitability is influenced by PE investment by 17.60% according to the coefficient of determination of 0.176030. Then, the coefficient of determination is determined to be 0.011946, which indicates that 1.19% of PE investment has an impact on sales growth. When all is said and done, a coefficient of determination of 0.007378 is found, indicating that a PE investment of 0.74% has an impact on the stock performance.

4.6 Discussion on Findings

4.6.1 Private Equity investment positively affects the liquidity

According to the first hypothesis study's findings, PE investment has a favorable impact on liquidity. Sincerre et al. (2019) show that corporations that disperse a big portion of their profits as dividends tend to avoid building up cash on their balance sheets or feeling forced to make little purchases or investments. These companies are usually young and developing, therefore they tend to pay less of their earnings as dividends (Jain et al., 2009). According to the idea of aligned interests, having a principal owner improves minority shareholder protection, which has a positive impact on cash and equivalents when private equity is present. Chen (2009) highlight the relationship between Venture Capital (VC) and cash and equivalents.

4.6.2 Private Equity investment negatively affects the leverage

According to the findings of the second hypothesis's test, PE investment had no impact on leverage. By communicating to financial markets the inherent worth of invested firms, these funds can significantly impact the amount of information asymmetry. Several facets of company finance policy can be impacted by lessening knowledge asymmetry (Myers and Majluf, 1984). The likelihood that wealth will be shifted from owners to creditors increases with the amount of corporate debt in the capital structure, agency expenses, and level of corporate leverage (Malau & Murwaningsari, 2018). Studies have shown that this does not always indicate that firms backed by private equity would issue shares more frequently (because they are more likely to obtain a fair price for their shares), leading to lower levels of debt). According to Tulus et al. (2019), firms with PE investments had less debt over the first five years following their initial public offering. This finding contradicts with that of Yang et al. (2016), who discovered a link between financial leverage and poor corporate performance.

4.6.3 Private Equity investment positively affects the profitability

The results of the third hypothesis show that there is a positive effect of PE investment on profitability. Morsfield and Tan (2006) believe that companies that invest in private equity on average have superior investment performance than those that do not invest in private equity. (Wright et al., 2009) also conclude that private equity and purchases bring very important economic and social benefits, including profitability. According to study by Sincerre et al. (2019), PE investment businesses exhibit stronger profitability in the near term (3 years after IPO), which is in accordance with this as well. A high return on assets (ROA) suggests that all

of the assets used by the business can be profitable. On the other hand, if the ROA is negative, the total assets utilised do not result in a profit or loss (Malau, 2020).

4.6.4 Private Equity investment positively affects the sales growth

According to the findings of evaluating the fourth hypothesis, PE investment positively impacts sales growth. An additional statistic to assess a company's operational effectiveness is its sales performance. Concerning erratic sales growth, Puri and Zarutskie (2012) show that private equity-funded companies experience faster sales growth than non-funded companies. Before growth rates stabilize, this effect is prevalent in the early years. Paglia and Harjoto (2014) shows that private equity and venture capital benefit sales growth. According to the authors, these findings persisted three years after PE began investing. In addition, Sincerre et al. (2019) support that private equity-backed companies have higher short-term sales growth (3 years after IPO).

4.6.5 Private Equity investment positively affects the stock return

The fifth hypothesis shows that there is no effect of PE investment on stock returns. Hertz et al. (2002) look at the stock-price performance of publicly traded companies that are raising private equity. They specifically discover that while announcement-period returns are good, the stock's post-announcement price performance for the three years after the offering is disproportionately poor. According to Hertz et al. (2002), this data may point to managerial overconfidence and the investors' failure to notice it. Their reasons support the under-reaction hypothesis, but their data contradict it. The windows of opportunity concept, in which businesses sell shares to private investors at the greatest price achievable, is supported by their results instead.

CONCLUSION

According to the results, PE investment has an impact on company performance, particularly financial performance, which in this study is liquidity, profitability, and sales growth. According to the principal-agent theory, PE will reduce the principal-agent issue that occurs between the principal (investor) and the agents (management). According to the principal-agent method, there are various ways to decrease agency costs, one of which is to agree on suitable agent conduct to avoid unwanted behavior, and the principle will spend monitoring expenses to assure this. On the other hand, the result indicates that for the Indonesia's stock market, PE investment might not impact on stock performance. This also indicates that Indonesia's market still not really aware on impact of PE investment in their portfolio companies.

IMPLICATION

Despite its importance, PE has an impact and influence on a company's success for investors. However, based on the findings of the study, it can be inferred that Indonesian investors must be made aware of the impact of PE investment on their portfolio firms. Consider PE as a funding alternative for practitioners/entrepreneurs that have a promising future business and are looking for another approach to fund it while also improving the company's performance. PE investments are one of the capital structure alternatives that have a major impact on the growth of businesses. It is also critical for the regulator to develop the Indonesian investment ecosystem in order to boost the investment landscape. This is critical in order to

provide predictability and security to domestic and foreign businesses looking to invest in Indonesia. This might have a good influence on Indonesia's economic growth.

LIMITATION

Since the firms being invested in by Private Equity listed on the Indonesia Stock Exchange are still considered to be few in number and the observation period still relatively young, it is fairly rigid to have varied point of view to be researched, which is one of the constraints of this research. This study's research was not restricted to any one particular industry listed on the Indonesia Stock Exchange. As a result, there are several factors that prevent generalization to all industries. Additionally, the duration of this investigation was unknown. Depending on the year of the IPO or the year of the PE investment, it may vary from earlier times to more current ones. As a result, the market environment may change from one sample to the next.

RECOMMENDATION

It is advised to determine more parameters for each group (both for companies being invested by Private Equity and not being invested by Private Equity), while also focusing on the specific sectors / industries to reduce the difference on the characteristics of the business.

ABSTRACT

This research discusses the consequences of the Covid-19 pandemic in terms of several aspects. An aspect that will be discussed in this study and has never been discussed by other researchers is the fusion of digital innovation, population, and environment towards socioeconomics. The purpose of this study is to determine the impact of population numbers, and digital innovation, on socioeconomics in DKI Jakarta Province and mediated by the environment. In data analysis, the author used the SEMPLS method, with a total of 30 respondents. The variables in this study have been validated by three experts, where the expert is the head of the task force appointed to deal with the pandemic in DKI Jakarta. The ultimate goal of this study is to get indicators of what has the most influence on Covid-19. From the results of the study, it was found that all indicators in this study had an influence on the socioeconomics due to the Covid-19 pandemic.

Keywords: Pandemic, Covid-19, DKI Jakarta, Socio-Economic, SEMPLS

INTRODUCTION

The spread of covid-19 is currently based on data obtained by the author through the website (DKI Jakarta Provincial Government, 2022) that currently there are 6,402,686 confirmed positive cases on the Indonesian national scale with information as many as 29,126 or as many as 0.5% confirmed positive, then as many as 6,215,711 or 97% confirmed recovered, and 157,849 or as many as 2.5% confirmed died. Meanwhile, the confirmed cases of Covid-19 for the DKI Jakarta area, namely 1,414,292 positive confirmed cases, with details of 660 or as many as 0.0% confirmed treated, 1,389,381 or 98.2%, then confirmed 15,551 or 1.1% died, and the last as many as 8,700 or as many as 0.6% confirmed positive and self-isolated.

The covid-19 pandemic is also a major change in digital innovation in Indonesia. One of the accelerations of digital transformation is in the health sector, where before the covid-19 outbreak, treatment consultations by coming to the doctor. In accordance with its development, telemedicine was born to make it easier for patients to consult a doctor. According to (Kuntari, 2022) People's habits at this time, especially during a pandemic, have certainly been adjusted when compared to people's habits before the pandemic. Society is increasingly open to the development of the times, especially the rapid development of technology. This certainly affects the ability of the community, especially the younger generation, to be able to adjust to the flow of information development digitally which is considered to be growing rapidly. In accordance with (Law, 2016) concerning Information and electronic transactions where the services that need to be considered are all matters related to technology and networks. The existence of internet facilities that support digital media can certainly be used as reference material to find various sources of information because we know that everything in people's lives today has been digitized with increasing technological advances.

When the spread of covid 19 occurred, then the discussion about the transmission of disease through animals, especially wildlife which is often sold illegally. This means that the public or the wider community also highlights the need for the government and officials to truly control the level of poaching and illegal trade of these animals. Based on this view, many people flocked to provide input to the government to prevent transmission by carrying out social restrictions in several areas, including restrictions on the sale of wild animals that were considered dangerous. According to research (Mella Ismelina Farma Rahayu, 2021) the occurrence of the Covid-19 pandemic is inseparable from the problem of environmental damage that occurs.

In addition to having an impact on the total population in Indonesia, especially the province of DKI Jakarta, then other impacts are also on digital innovation and the environment. In fact, the socio-economic field is also one of the factors that are believed to have a strong influence due to Covid-19. The decline in people's income is an important assessment of the decline in the economic level of the community. With the Covid-19 virus pandemic, the economy has experienced a decline, especially for market traders who experienced a decrease in turnover and income by 50% (Di et al., n.d.) . In the study (Noersanti et al., 2021) it was also stated that the socioeconomic impact is not only around increasing poverty due to many who have lost their jobs, difficulty accessing health, but also including the cultural realm where there is increasingly unequal gender inequality which is widely complained about by women.

1. CHAPTER 1 - LITERATURE REVIEW

In population theory, Thomas Robert Malthus stated that the number of inhabitants would exceed the amount of food supplies needed then Malthus was very concerned that the amount of time required for the population to double the number was very short, he described that if no

restrictions were made, the population tended to develop according to a series of measures. From these series, it can be seen that there will be an imbalance between the number of people and the supply of food. Within 200 years, this ratio will be 256 : 9. (Mantra, 2000)

Uncontrolled population growth according to Lincoln will cause various problems and obstacles to the efforts made, because such high population growth will cause a rapid increase in the number of workers, while the ability of regions to create new job opportunities is very limited (Arsyad, 2004)

There are several things that can be an obstacle to the rate of population growth. It can be divided into 2, namely:

- A. Positive checks or events that are outside human power such as, natural disasters, famines, infectious diseases, wars and murders.
- B. Preventive checks or things that can be attempted by oneself such as, postponing marriage or marriage and permanent celibate (Malthus, 2018)

The adaptation of the company's business concept to match the automation brought by the industry 4.0 concept is carried out with a digital transformation program (digital transformation). Some experts define digital transformation as follows:

- A. Digital Transformation is an evolutionary process that leverages digital capabilities and technologies to enable business models, operational processes and customer experiences to create value (Gatautis et al., 2014).
- B. Digital Transformation is concerned with "the changes digital technologies can bring about in a company's business model, which result in changed products or organisational structures or automation of processes" (Clohessy in Gatautis et al., 2017:111).
- C. Digital transformation is not about technology, but rather about new strategies and perspectives (Rogers, 2017)

The living environment is the sum of all objects and conditions that exist in the space we occupy that affect our livelihood (Silalahi, 2001). The term environment, in English is called environment, in Dutch it is called milieu and in French it is called environment. According to Munadjat Danusaputro, "The living environment is all objects and conditions, including man and his deed behavior contained in the space where man is located and affects the life and well-being of man and his life body" (N.H.T.Siahaan, 2004). According to the understanding (32, 2009), the living environment is defined as the unity of space with all living objects, potentials, states, and beings, including humans and their behavior, which affects nature itself, the survival of life, and the well-being of humans and other living beings. Human beings since being born in this world, have been in a certain living environment. The environment is an absolute part that cannot be separated from human life with all its life activities foraging, drinking and meeting other needs, is because there is an environment as the first and most important source for the fulfillment of these various needs.

The environment in which humans live is categorized into three basic groups, namely:

- A. Physical environment (physical environment), namely everything around us in the form of inanimate objects, such as houses, vehicles, uadara, water and so on.
- B. Biological environment (biological environment), that is, everything that is around humans in the form of living organisms apart from humans themselves.
- C. Social environment, that is, humans around it, such as neighbors, friends, and other people around him who are not yet known (Subagyo, 2002)

Based on the literature review, the following is the development of a hypothesis that describes

the relationship between the variables that will be studied in this study.

- H1 : Population affects the Environment
- H2 : Digital Innovation affects thE Environment
- H3 : Population affects socioeconomics
- H4 : Digital Innovation affects socioeconomics
- H5 : Environment affects socioeconomics
- H6 : Population affects socioeconomics in environmental mediation
- H7 : Digital Innovation affects Socioeconomics in Environmental mediation

2. CHAPTER 2 - RESEARCH METHOD

This study was conducted using a quantitative approach, because the purpose of this study was to obtain variables that affect the socioeconomics due to the occurrence of the Covid-19 pandemic in DKI Jakarta. The selection of SEM-PLS as a method of data analysis, is based on the characteristics of the research object, the assumptions underlying the model, and based on its virtues. The reason for using the SEM-PLS approach, because: 1) SEM-PLS in the past decade has become an important concern in academics and researchers (Joseph F. Hair et al., 2013); 2) SEM-PLS has been widely used in several scientific studies, such as management (Richter et al., 2016), organizational management (Henseler et al., 2012), strategic management (Furrer et al., 2012; Joe F Hair et al., 2012), accounting (Lee et al., 2011), information systems management (MacKenzie et al., 2011; Ringle et al., 2012), operations management (Peng &Lai, 2012) and so on. SEM-PLS comes as an alternative when some of the basic assumptions of CB-SEM are not met or the essence of the objectives of the model developed is aimed at using SEM-PLS (Asyraf & Afthanorhan, 2013). Other reasons for using the SEM-PLS approach, are mainly: 1) SEM-PLS can describe the main target construct variants (Joe F Hair et al., 2012; Reinartz et al., 2009); 2) SEM-PLS sample size although relatively small, will still achieve good statistical strength (Joe F Hair et al., 2012; Reinartz et al., 2009); and 3) SEM-PLS is able to handle complex models with many model relationships and a large number of indicators (Joe F. Hair et al., 2014).

The approach of using SEM-PLS is important to pay attention to the stages involving:

- 1) model specifications;
- 2) evaluation of measurement models; and
- 3) evaluation of structural models.

SEM analysis will result in a relationship between the free variable and its bound variable. The relationship between its variables will be described as below, namely:

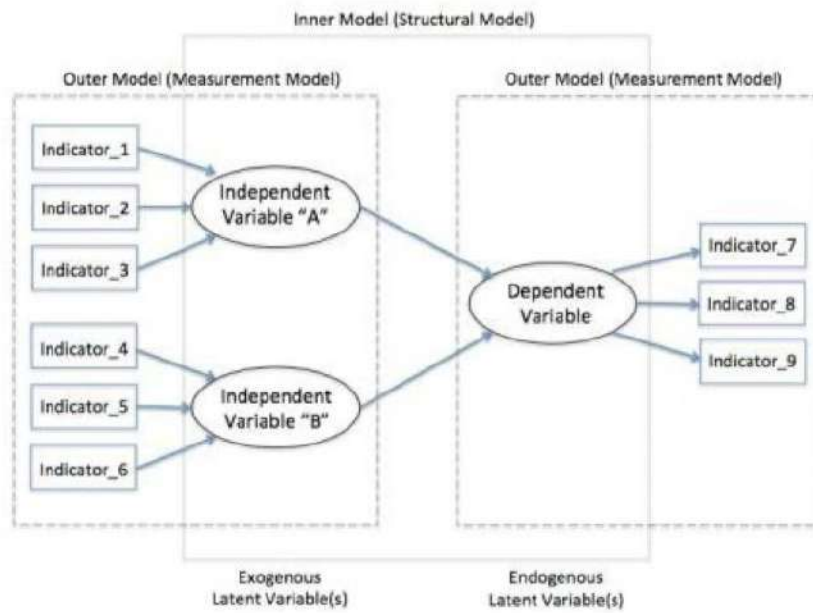

Figure 1 Relationship of latent variables on SEM Source: Ken Kwong-Kay Wong (2013)

On the basis of the above discussion, this research model includes latent variables of hierarchy with reflective-formative type. The latent variables and dimensions (construction of the research path model) are shown in the following figure.

Figure 2 Construction of the Research Path Model Source : Olahan Author, 2022

3. CHAPTER 3 - RESULTS AND DISCUSSION

3.1 Expert Characteristics

In data collection, researchers conduct interviews and provide questionnaires as validation of expert answers to meet the needs of the study. Here is expert data that assists researchers in conducting research validation.

Table 1 List of Expert

Code	Expert	Initials	Gender	Position	Experience (Years)	Education
P1	Expert 1	Na	L	Head of Covid-19 Handling Jakarta	28 Years	S2
P2	Expert 2	Sg	L	Head of Jakarta Hospital	24 Years	S2
P3	Expert 3	Sa	L	Doctors Handling Covid Cases	18 Years	S2

Based on the table above, it can be explained that all experts who assist researchers in determining the assessment points for the questionnaire are to have a position as Head of Handling Covid-19 Jakarta with a long work of more than 28 years.

Structural Equation Modelling analysis on respondent data aims to find the most influential variables in Digital Innovation of construction projects. In this study, SMARTPLS software was used to model variables that have been validated by experts. The analysis carried out is an outer model and inner model test. Outer models are useful for showing how the indicators that have been created can represent the latent variables that are measured. Outer model tests can also be used to test the validity and reliability of indicators from the set of variables that have been created. Meanwhile, the inner model test is used to measure the causal relationship between the variables that have been made.

3.2 Test Outer Model

The *outer model* test using SEM aims to test the validity and reliability of the data obtained. This validity and reliability test is carried out to determine whether the indicator can be properly used to measure a variable. Validity testing is divided into two, namely convergent validity and discriminant validity. The validity of convergence can be seen from the correlation value between indicators and variables (Outer Loading) greater than 0.7. In addition to using outer loading values, convergent validity can also be seen from the Average Variance Extracted (AVE) value. A model can be said to be valid if it has an AVE value for each variable above 0.5. The validity of the discriminant can be seen the AVE root value for each variable with the variable itself having the largest value when compared to other variables. The value can be seen in the Fornell Lacker section of the SMARTPLS application. In addition, the validity of the discriminant can be seen from the outer loading value of an indicator with its variables must be greater than that indicator with other variables. The value can be seen in the Cross Loadings section of the SMARTPLS application. Reliability testing in this study used Composite Reliability and Cronbach Alpha values. An indicator can be declared reliable if the composite reliability and Cronbach Alpha values are above 0.70

3.3 Convergent Validity

Table 2 Convergent Validity

No.	Variable	Variable Code	Indicators	Indicator Code	Loading Factors	Ave	Conclusion
1	Total Population	X1	Fertility Problems	X1.1	0,720	0,511	Valid
			Mortality Problems	X1.2	0,960		Valid
			Migration Issues	X1.3	0,769		Valid
2	Digital Innovation	X2	Digitization	X2.1	0,838	0,591	Valid
			Digitalization	X2.2	0,685		Valid
			Digital Transformation	X2.3	0,598		Valid
3	Hidup Neighborhood	X3	Physical Environment	X3.1	0,802	0,68	Valid
			Biological Environment	X3.2	0,837		Valid
			Social Environment	X3.3	0,839		Valid
4	Socio-Economic	X4	Education Level	X4.1	0,913	0,81	Valid
			Work	X4.2	0,881		Valid
			Income	X4.3	0,818		Valid

Convergent validity value is the value of the loading factor on a latent variable with its indicators. Convergent validity is assessed based on the correlation between the item score or compound score and the construct score calculated by PLS. To be measured, but in this case, the author refers from the standard (Hair et al., 2014) that the loading value used is 0.5

Figure 3. Diagram with SEMPLS

3.4 Discriminant Validity

Evaluation of *Discriminant Validity*, using assessments from *Cross Loadings*, *Fornell- Larcker Criterion*, and *Heterotrait-Monotrait (HTMT)*. The *Cross Loadings* value of each correlated construct must be higher than other construct values (Hair et al., 2014). The *Fornell- Larcker* evaluation was assessed based on the square root value of the AVE of each construct correlated with the other construct. If each construct has an AVE square root value higher than its correlation value, then the model has good discriminant validity (Fornell & Larcker, 1981). Furthermore, an HTMT assessment is carried out to ensure the validity of the discriminant between the two correlated reflective constructs, with the HTMT value must be less than 0.9 (Henseler et al., 2015). Evaluation of discriminant validity testing is presented in the following tables. The results showed that the *cross loading* value showed that all constructs had a higher correlation than other construct correlations. Then it can be stated that this evaluation has been successful and has met the validity of the discriminant. Furthermore, a *fornell-larcker* test will be carried out presented in the Table 3 below.

Table 3. *Discriminant Validity Test*

Indicators	Total Population	Digital Innovation	Environment	Socio-Economic
toX21	0,500	0,450	0,495	0,598
X22	0,701	0,687	0,605	0,832
X31	0,703	0,642	0,839	0,763
X32	0,659	0,594	0,837	0,723
X33	0,538	0,417	0,802	0,538
X51	0,763	0,576	0,603	0,719
X52	0,903	0,698	0,717	0,696
X53	0,907	0,761	0,655	0,733
Y1	0,787	0,950	0,619	0,721
Y2	0,762	0,948	0,623	0,722
Y3	0,671	0,575	0,597	0,665

Fornel-Larcker's results show that all the values of the AVE square root of the construct that are correlated with other constructs have met the validity of the discriminant, because the correlated AVE square root value of the construct is greater than the value of other constructs, except socioeconomics and project owners have a smaller correlation than the corelasi other constructs.

Table 4. *Fornell-larcker test*

	Population numbers	Digital Innovation	Environment	Socio-Economic
Population numbers	0,867			
Digital Innovation	0,816	0,949		

Environment	0,747	0,654	0,822	0,875
Socio-Economic	0,814	0,760	0,794	0,769

Furthermore, HTMT testing is presented in the Table 5 below. Based on the results of the HTMT table above, in this HTMT test, it can be said that it meets the validity of the discriminant. Because some correlations between constructs have an HTMT value smaller than 90.

Table 5. HTMT Test

	Population numbers	Digital Innovation	Environment	Socio-Economic
Population numbers				
Digital Innovation	0,875			
Environment	0,317	0,141		
Socio-Economic	0,797	0,627	0,525	0,828

3.5 Internal Consistency Reliability

The reliability of the indicators in building the model is said to be reliable or not, if *the Composite Reliability* value between 0.70 – 0.95 has a satisfactory level of reliability (Hair et al., 2014), and the value of *Cronbach's Alpha* is expected to be above 0.70 (Ghozali & Latan, 2015). The results of testing the reliability of each indicator are presented in the following Table.

Table 6. Internal Consistency Reliability

	Cronbach's Alpha	Composite Reliability
Total Population	0,889	0,923
Digital Innovation	0,890	0,948
Environment	0,882	0,912
Socio-Economic	0,959	0,963

The results of *composite reliability* and *cronbach's alpha* tests are at the level of good test criteria. Thus the items used have been reliable and consistent in building research models, because they are above 0.70.

3.6 Structural modes evaluation

Evaluation of the structural model is carried out to find out whether the model built is at the level of good test criteria. After the evaluation of the measurement model has met its assumptions, a structural model evaluation is then carried out. The structural model uses *R-Square (R²)*, *Q-Square Test (Predictive Relevance)*, *Goodness of Fit (GoF) Test*, and *Path Coefficients* (Sarstedt et al., 2017) test evaluations.

3.6.1 R-Square (R²)

The evaluation of *the R-Square* test aims to determine the ability of exogenous variables to

explain endogenous variables. The assumption is that chin values provide the criteria for R Square values of 0.67, 0.33 and 0.19 as strong, moderate, and weak (Chin, 1998 in Ghazali and Latan, 2015). The following are presented the results of the evaluation of the R² test as in the Table 7 below.

Table 7. 10 R-Square Evaluation Results (R²)

	R Square
Delay	0,711

Based on the results of the R test evaluation² the delay indicators described by Population Numbers, Digital Innovation, Environment are (0. 711 = strong). That is, the ability of exogenous variables built in explaining endogenous variables has met the level of good test criteria or good models.

3.6.2 Goodness of Fit Index (GoF) Test

The *Evaluation of the Goodness of Fit Index (GoF)* test aims to validate the combined performance of the measurement model with the structural model. The GoF assessment uses criteria levels of 0.1 (small *GoF*), 0.25 (medium *GoF*), and 0.36 (large *GoF*) (Hair et al., 2013). GoF calculations are obtained through the following calculations:

$$\begin{aligned}
 GoF &= \sqrt{AVE \times R^2} \\
 &= \sqrt{0.847 \times 0.711} \\
 &= \sqrt{0.6022} \\
 &= 0.7760
 \end{aligned}$$

Information:

$$\begin{aligned}
 AVE &= (0.752 + 0.805 + 0.676 + 0.591 + 0.511)/5 \\
 &= 4,235 /5 \\
 &= 0.847 \\
 R^2 &= 0.711
 \end{aligned}$$

The calculation results of the *Goodness of Fit Index (GoF) Test* obtained 0. 7760. That is, the combined performance of the measurement model with the structural model can be said that the model has met the good performance at the level of the test criteria, since the *GoF* value is above 0.36 (large *GoF*).

3.6.3 Path Coefficients

Path coefficient evaluation aims to find out which structural model is built to have the influence of path coefficient according to its assumptions. The value of the path coefficient from -1 to +1, the closer to +1 the relationship will be stronger and vice versa (Sarstedt et al., 2017). If using the degree of significance ($\alpha = 5\%$), then the value ($p\text{-value} < 0.05$) (Hair et al., 2014), and the *t-value* of >1.96 (Ghozali & Latan, 2016) can be expressed the influence between exogenous variables and endogenous variables is significant, and vice versa. The results of the structural model are presented in the following Figures and Tables.

Table 8. *Path Coefficients*

	β	T Statistics	P Values
Population Number -Socioeconomic >	0.416	9.135	0.000
Digital Innovation -Socioeconomic >	0.179	4.030	0.000
Environment -Socioeconomic >	0.185	4.075	0.000
Total Population -> Environment	0.179	3.252	0.001
Digital Innovation -Environmental >	0,406	4,266	0,000
Total Population -> Environment- Socioeconomic >	0,332	3,54	0.000
Digital Innovation .> The Environment - Socioeconomic >	0,245	3,88	0,001

The results of the evaluation of structural model testing both direct and indirect influences using *bootstrapping* procedures can be interpreted as follows:

- A. The path coefficient of The Number of Populations ($\beta = 0.416$; $t = 9.315 > 1.96$; $p = 0.000 < 0.05$) has a positive and significant effect on socioeconomics, meaning H1 is accepted.
- B. The coefficient of the Digital Innovation path ($\beta = 0.179$; $t = 4.030 > 1.96$; $p = 0.000 < 0.05$) has a positive and significant effect on socioeconomics, meaning that H2 is accepted.
- C. The coefficient of the Environmental path ($\beta = 0.185$; $t = 4.075 > 1.96$; $p = 0.000 < 0.05$) has a positive and significant effect on socioeconomics, meaning H3 is accepted.
- D. The path coefficient of The Number of Populations ($\beta = 0.179$; $t = 3.252 > 1.96$; $p = 0.001 < 0.05$) has a positive and significant effect on the Environment, meaning that H4 is accepted.
- E. The coefficient of the Digital Invocation path ($\beta = 0.406$; $t = 4.266 > 1.96$; $p = 0.000 < 0.05$) has a positive and significant effect on the Environment, meaning that H5 is accepted.
- F. The path coefficient of The Number of Populations ($\beta = 0.332$; $t = 3.54 > 1.96$; $p = 0.000 < 0.05$) has a positive and significant effect on the Socioeconomic mediated Environment, meaning H6 is accepted.
- G. The coefficient of the Digital Innovation pathway ($\beta = 0.245$; $t = 3.88 > 1.96$; $p = 0.001 < 0.05$) has a positive and significant effect on the Socioeconomics mediated by the Environment, meaning that H7 is accepted.

4. CHAPTER 4 – CONCLUSION

Based on all stages of analysis at SEMPLS, it can be concluded that all indicators on the variables of Population Number, Digital Innovation, and Environment affect the Socio-Economic due to the Covid-19 pandemic. From the results of the analysis above, it can also be concluded that vaiabel Population Numbers and Digital Innovation affect the Socio-Economic mediated by the Environment

ÖZET

Sosyoekonomik dönüşümlere koşut olarak tarihsel süreç içerisinde kurumların yönetim stillerinde dönüşümler gerçekleşmiştir. Sanayi Devrimi'nden itibaren başta Avrupa ve Amerika olmak üzere tüm dünyada yönetim, bir bilim dalı olarak kabul edilmektedir. Yönetim ve yönetici, toplumsal yaşam ve iş dünyası için elzem kavramlardır. Bununla birlikte yönetim kavramının değişimine koşut olarak yönetici kavramı da değişime uğramakta ve yönetici kavramına yüklenen anlam ile beklentiler farklılaşmaktadır.

'Chief Executive Officer' kelimesinin akronimi olan CEO, en yalın ifadeyle bir şirketin en üst düzey sorumlusudur. Konumu ve sorumlulukları itibarıyla şirket için yaşamsal öneme sahip olan CEO, geniş bir yetki ve sorumluluk alanına sahiptir. Tüm kavram ve olgular gibi CEO kavramı da, zaman içinde değişmekte ve dönüşmektedir. Öyle ki günümüzün rekabet yoğun iş ortamında CEO, marka statüsünde bir değer olarak kabul görmekte ve etki alanını gün geçtikçe artırmaktadır. Bu bağlamda ki iş dünyası açısından CEO kavramı ve konumu, CEO ile ilişkilendirilen işlev ve sorumluluklar, CEO'nun temsil ettiği bilgi, beceri ve yetkinlikler; üzerinde konuşulan ve tartışılan bir nitelik arz etmektedir.

Bu çalışma, CEO kavramına odaklanmakta ve CEO'nun işlev ve sorumluluklarını kavramsal bir bakış açısıyla ele almaktadır. Çalışma kapsamında CEO kavramı, CEO'nun yönetsel-örgütsel anlam ve önemi, görev ve sorumluluk alanları, sahip olması gereken bilgi, beceri ve yetkinlikleri konu edilmektedir. Çalışma ile CEO kavramının görev ve sorumluluklarına açıklık getirerek alanyazına tanımlayıcı bir katkı sunmak hedeflenmektedir.

Anahtar Sözcükler: Yönetim, örgüt, yönetici, lider, CEO.

Functions and Responsibilities of The CEO: A Conceptual Framework

ABSTRACT

In parallel with the socioeconomic transformations, there have been transformations in the management styles of the institutions in the historical process. Since the Industrial Revolution, management has been accepted as a branch of science all over the world, especially in Europe and America. Management and manager are essential concepts for social life and business world. However, in parallel with the change in the concept of management, the concept of manager also undergoes a change and the meaning attributed to the concept of manager and expectations differ.

6th International CEO Communication, Economics, Organization & Social Sciences Congress

The acronym for the word 'Chief Executive Officer', the CEO is, in the simplest terms, the highest level officer of a company. The CEO, who is of vital importance for the company in terms of their position and responsibilities, has a wide range of authority and responsibility. Like all concepts and phenomena, the concept of CEO also changes and transforms over time. So much so that in today's intensely competitive business environment, the CEO is accepted as a value in brand status and is increasing its sphere of influence day by day. In this context, in terms of the business world, the concept and position of the CEO, the functions and responsibilities associated with the CEO, the knowledge, skills and competencies represented by the CEO is a subject that is talked about and discussed.

This study focuses on the concept of CEO and considers the functions and responsibilities of the CEO from a conceptual perspective. Within the scope of the study, the concept of CEO, the managerial-organizational meaning and importance of the CEO, their duties and responsibilities, the knowledge, skills and competencies they should have are discussed. The aim of the study is to make a descriptive contribution to the literature by clarifying the duties and responsibilities of the concept of CEO.

Key Words: Management, Organization, Manager, Leader, CEO.

Introduction

As the top executive of an organization, the CEO is the primary responsible for the entire operation of the organization. All strategic, managerial, organizational, communicative and competitive decisions and practices of the organization are shaped and executed by the CEO. In this context, it is not possible to imagine a corporate structure without a CEO. Management is not an accidental and spontaneous process. For an effective management, a manager with knowledge, skills and experience is needed.

The CEO is at the top of an organization's managerial-organizational hierarchy and acts as the ultimate custodian of the organization. In this context, the scope of the CEO's field of duty, the breadth of their authority, the scope of the knowledge, skills and competencies they should have are of a nature that has been discussed and researched in the literature. The starting point of this study is to examine the functions and responsibilities of CEOs and to develop a conceptual perspective.

CEO

CEO is one of the most popular concepts of today's society and business world. When considered terminologically, the word CEO is an acronym consisting of the initials of the English word 'chief executive officer'. When considered conceptually, the word CEO can be considered as an umbrella concept that includes all three concepts in the said component.

The Collins Dictionary (2023) defines a CEO as “is the person who has overall responsibility for the management of that company”. Looking at this definition, the responsibilities of the CEO are emphasized. The CEO has many responsibilities at many levels in the organizational hierarchy. The Merriam-Webster Dictionary (2023) defines the CEO as “the executive with the chief decision-making authority in an organization or business”. In this definition, it is emphasized that CEOs are the organizational decision-making authority. The Britannica Dictionary (2023) defines the CEO as “the person who has the most authority in an organization or business”. In the Longman Dictionary (2023), CEO is defined as “the person with the most authority in a large organization” with the same emphasis.

As all these definitions indicate, the CEO identifies with authority. CEOs carry out their duties and responsibilities through their competencies and authorities. Therefore, it is understood that the CEO is expressed in terms of duties, authorities and responsibilities at the concept and application level. In other words, the concept of CEO becomes meaningful within the framework of the duties undertaken, the authorities applied, the responsibilities fulfilled and the achievements. In accordance with this point of view, the duties, responsibilities and authorities of CEOs; is something that needs to be scrutinized.

Roles and Responsibilities of the CEO

As the terminology reveals, the CEO is the key person of an organization. When considered as a duty and a profession, CEO has an increasing popularity all over the world, especially in America. In parallel with globalization and the increase in the efficiency of business life, the CEO has become one of the leading concepts of social life. In this sense, it would not be wrong to consider the CEO as a symbol of the American style of life and business.

CEO of major corporations have often had larger-than-life images in American culture. CEOs regularly grace magazine covers and news headlines. Four times in the last 25 years Time magazine has selected CEOs of US corporations as their ‘Person of the Year’: Ted Turner, Andrew Grove, Jeff Bezos, and Mark Zuckerberg. Prominent advertising campaigns have linked the images of companies with the images of their high-profile CEOs-think Lee Iacocca and Chrysler, or Dave Thomas and Wendy’s. CEOs also author books to share their stories and advice with the world. Andrew Grove of Intel, for example, has written four such books: *Only the Paranoid Survive: How to Exploit the Crisis Points That Challenge Every Company*; *One-*

6th International CEO Communication, Economics, Organization & Social Sciences Congress

on-One with Andy Grove: How to Manage Your Boss, Yourself, and Your Coworkers; High Output Management; and Swimming Across: A Memoir. They even appear on popular television shows (for example, Bill Gates on *Frasier* and Lee Iacocca on *Miami Vice*) and run for major political offices including President of the United States (for example, Ross Perot of Electronic Data Systems and Perot Systems in 1992 and Carly Fiorina of HP in 2016) (Malmendier & Tale, 2012: 37).

The basic approach of organization-oriented knowledge management issues is to improve organizational performance, typically by facilitating the division of work, duties, and responsibilities, as well as coordinating work (Mintzberg, 1992). In this context to describe the work life of a CEO, Mintzberg first identified six characteristics of the job: (1) Managers process large, open-ended workloads under tight time pressure - a manager's job is never done. (2) Managerial activities are relatively short in duration, varied and fragmented and often self-initiated. (3) CEOs prefer action and action driven activities and dislike mail and paperwork. (4). They prefer verbal communication through meetings and phone conversations. (5). They maintain relationships primarily with their subordinates and external parties and at least with their superiors. (6). Their involvement in the execution of the work is limited although they initiate many of the decisions (Kumar, 2015: 12).

The CEO has many duties and responsibilities in an organization, regardless of the sector or size. It would be appropriate to explain the duties and responsibilities of the CEO based on Mintzberg's managerial roles. Studies on managerial roles gained importance with the work of Mintzberg. Mintzberg (1973: 4) points out that it is not possible with current understandings to explain what managers actually do. According to him, what is written about the managers' job is far from evidence and it is necessary to ignore this understanding not only because of the lack of evidence, but also because the researches have proven the opposite of the duties defined for the managers.

According to Mintzberg (1973, 1990), there are ten managerial roles. These roles that can be described as 'Figure-head', 'leader', 'liaison', 'monitor', 'disseminator', 'spokesperson', 'entrepreneur', 'disturbance handler', 'resource allocator', 'negotiator' shared via Figure 1.

Figure 1. Ten Managerial Roles of Mintzberg

Source: Developed by researchers from Mintzberg, 1973 & Mintzberg, 1990.

When the managerial roles are scrutinized in detail, it can be seen that the 'figure-head' role refers to the quality of the manager being watched and taken as an example by their subordinates. This role refers to the manager's representation in social and legal duties. In other words, as an authority figure, the CEO should be aware of their social and legal obligations. Under the figure-head role, the CEO represents the organization at various events. In this context, the role is functionalized as a source of motivation in the process of achieving the goals.

The 'leader' role describes one of the most important roles of a manager. A manager is responsible for taking the lead for the management team and guiding them properly. In this sense, the manager is responsible for the success and failure of all their employees from the bottom to the top of the hierarchy. To put it more clearly, the performances and responsibilities of all managed employees are parallel to the correct performance of the manager's task. In this context, the role of leader refers to the key role of the CEO in positioning the organization and employees on the scale of success and failure.

The 'liaison' role defines the manager's liaison role. Therefore, it includes the human relations and communications of the manager. Within the scope of the liaison role, the manager should establish a network of contacts that will benefit the organization by communicating effectively with both the internal and external environment of the organization. This role includes elements such as delegation and chain of authority, knowledge transfer and links with stakeholders.

The 'monitor' role refers to the manager's duty to monitor and supervise. This role means that the manager not only observes the subordinates, but also follows the developments inside and outside the organization and makes the necessary changes in line with these developments. By performing the role of monitor, the manager obtains the information they need for the organization and by monitoring the sectoral movements. The role of monitor means that the CEO evaluates the current situation in the light of the information they collect and draws a roadmap.

The 'disseminator' role can be defined as the manager getting information from various sources and sharing it with people who may need it. The manager follows the developments inside and outside the organization, shares the information and data obtained as a result of this follow-up with their subordinates and guides them accordingly; covered by this role. In line with the disseminator role, the CEO is responsible for the dissemination of information verbally and in writing, thus eliminating the communication gap and lack of information.

The role of 'spokesperson' means that the manager is the spokesperson for the organization for which they are responsible. Within the scope of this role, the manager informs the relevant people inside and outside the organization about the activities, defends the organization and expresses it on behalf of the organization. The spokesperson role corresponds to the CEO assuming the responsibility to speak on behalf of the organization and positioning the organization well and effectively in front of public groups.

The 'Entrepreneur' role can be defined as the manager's adaptation to and creating change. In this role, the manager develops and implements new ideas or strategies by finding innovative solutions while organizing and executing business processes. Entrepreneur is a role that overlaps with the CEO taking a competitive and innovative attitude.

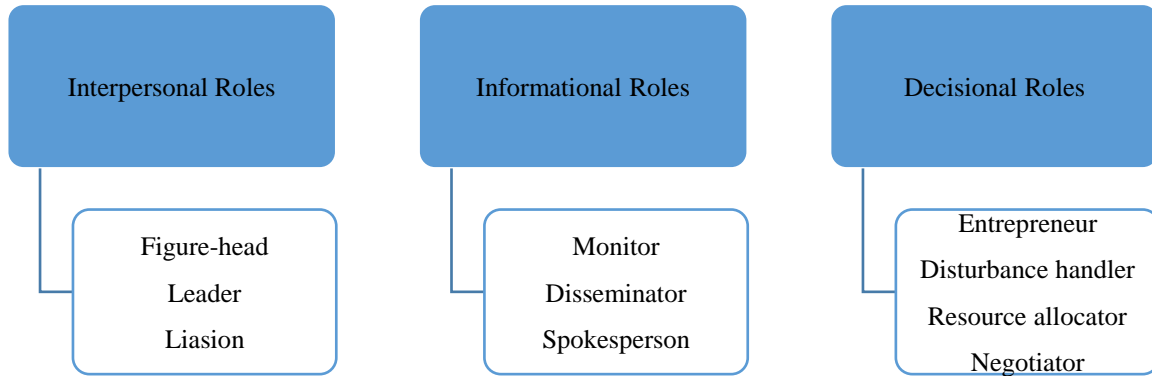

The role of 'disturbance handler' refers to a manager taking a conciliatory attitude in resolving disagreements in the organization. Within the scope of this role, the CEO takes an active position in problem solving processes by using their communication and empathy skills effectively.

The 'resource allocator' role refers to the manager's duties towards the resources that the organization needs. This role means the effective use of limited resources. Within the scope of the resource allocator role, the CEO develops a conscious behavior in terms of allocating, evaluating and associating resources with needs.

The 'negotiator' role emphasizes the negotiating side of the manager. The negotiator role can be defined as the manager's negotiation and reconciliation with the internal and external stakeholders of the organization.

It is also possible to address Mintzberg's management roles through categories. In this context, ten managerial roles can be examined in three categories: 'interpersonal roles', 'informational roles' and 'decisional roles'. In Figure 2, these managerial role categories are presented.

Figure 2. Managerial Role Categories

Kaynak: Developed by researchers using Mintzberg, 1973; Mintzberg, 1990.

The first category in managerial role categories is interpersonal roles. Interpersonal roles can be considered as 'figure-head' role, 'leader' role and 'liaison' role. The second category in managerial role categories is informative roles. These roles, which have a communicative nature, include the manager's 'monitor', 'disseminator' and 'spokesperson' roles. The third category in managerial role categories is decisional roles. Decisional roles can be explained as 'entrepreneur', 'disturbance handler', 'resource allocator and 'negotiator'.

As can be seen, Mintzberg's managerial classification is quite extensive. This classification is important in terms of determining which roles managers perform and which roles they perform more effectively. The activities carried out in accordance with the managerial roles and their scope are detailed in Table 1.

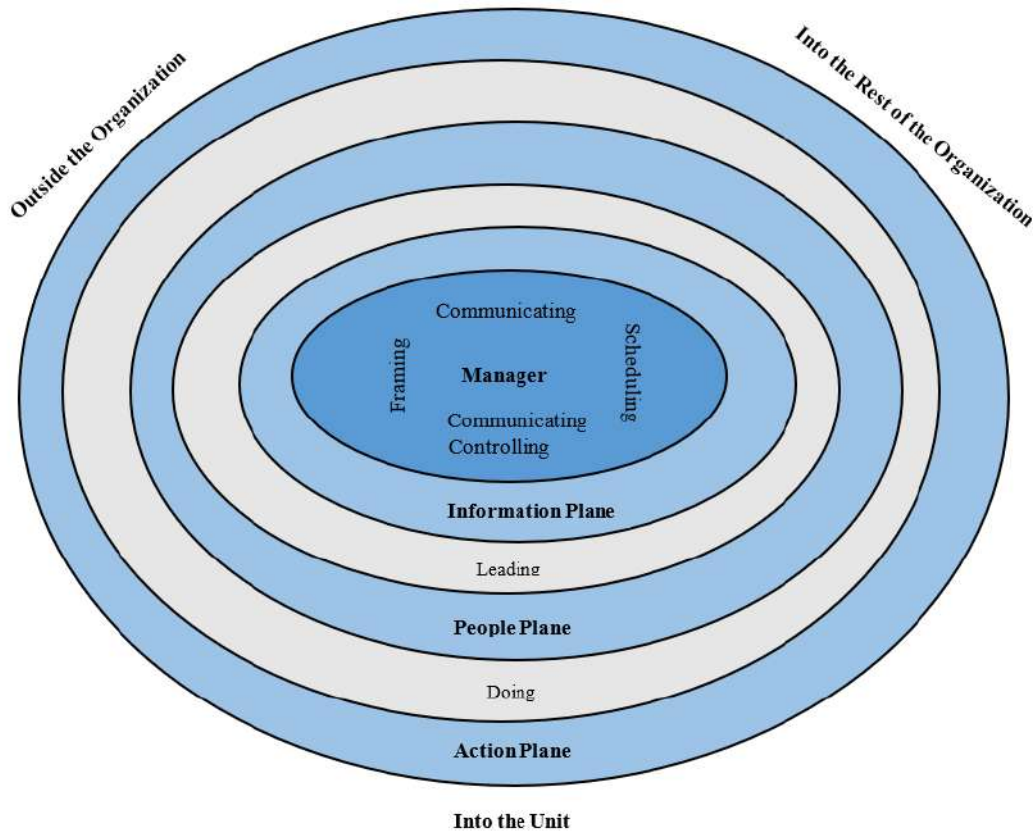

Table 1. Managerial Roles and Activities

	<u>Managerial Roles</u>	<u>Activities</u>
Interpersonal	Figure-head	Welcoming guests/visitors, signing official documents, attending ceremonies, giving receptions, etc.
	Leader	Managing, motivating, developing, mentoring, communicating with subordinates, developing relationships, encouraging subordinates, etc.
	Liaison	Establishing information connections within and outside the organization, reminding employees, having reports prepared and published, informing about the decisions taken, sending e-mails, making phone calls, holding meetings, etc.
Informative	Monitor	Searching and obtaining information, browsing news and magazines in the media, sending and following memos and reports, maintaining employee connections, attending seminars and training, establishing personal contacts, etc.
	Disseminator	Sending information to the members of the organization, sending short notes and reports, making phone calls, establishing business contacts, attending meetings, etc.
	Spokesperson	Transferring information out of the organization with speeches, reports and short notes, making speeches to discuss developing/expanding plans, communicating with outside the organization by attending conferences and meetings, etc.
Decisional	Entrepreneur	Innovation and making plans for the future, developing ideas, initiated projects etc.
	Disturbance handler	Taking the right action during discussions or crises, solving problems among subordinates, adapting to environmental crises, setting strategic direction, etc.

	Resource allocator	Deciding who will use the resources, determining the program, budget and priorities, reviewing and correcting the budget demands, reaching agreement with the workers' unions, representing the organization in union agreements, making decisions and explaining the decisions to the concerned, etc.
	Negotiator	Being involved in processes and solving problems on the basis of team, department or organization, etc.

Source: Tabulated by researchers from Rüzgar & Kurt, 2013, Şeker, 2014.

Figure 3. The Model of Managing

Source: Mintzberg, 2009a.

In the management model in Figure 3, the manager is in the center. The manager is surrounded by the unit they manage. In addition, it includes the rest of the organization and the outside world associated with them. The figure has three basic planes. These are the information plane, the people plane, and the action plane. The manager in the center has two main duties. These are: framing and scheduling work on management actions. In this context, framing is defined as the way the manager approaches their work. There are different aspects of management such as decision making, strategy development, focusing on specific issues. Scheduling includes the manager's time management and work planning process (Nguyen, 2011).

Today's business environment is different from the past, although it is based on the past. Experienced changes and developments ensure that the roles and duties of CEOs also change and diversify. In today's environment, the roles of CEOs are evolving. CEOs are leaders who function successfully not only within their own organization but also in the external environment in which the organization operates. For this, CEOs must have characteristics that

match the dynamics of the internal workings of the organization as well as the dynamics of the external environment and external stakeholders. Also, since the external environment of the organization is constantly changing, the qualifications of CEOs should be geared towards meeting this requirement so that the organization can work efficiently in the ever-changing environment (Sarna, 2022).

In the current conditions, the CEO is responsible for performing many roles within and outside the organization in terms of their duties and responsibilities. CEO's managerial duties, roles and role categories as seen in Table 2, is possible to detail as 'informational roles', 'interpersonal roles', 'decisional roles', 'operational roles', 'strategic roles', 'diplomatic roles', and 'brand roles'.

Table 2. Managerial Roles and Role Categories of the CEO

<u>Informational Roles</u>	<u>Interpersonal Roles</u>	<u>Decisional Roles</u>	<u>Operational Roles</u>	<u>Strategic Roles</u>	<u>Diplomatic Roles</u>	<u>Brand Roles</u>
- Monitor - Disseminator - Spokesperson - Commander	- Leader - Motivator - Director - Coach - Team leader	- Entrepreneur - Employer - Resource allocator - Disturbance handler - Conflict handler - Taskmaster - Negotiator - Problem solver - Consultant	- Organizer - Analyzer - Operator - Technical expert	- Coordinator - Innovator - Planner - Strategist - Tactician - Visioner - Change Agent - Transformer	- Link / Statesperson - Figure-head - Liasion	- Brand spokesperson - Brand ambassador - CEO brand - Social responsibility

Kaynak: Tabulated by researchers from Mintzberg, 1973; Mintzberg, 1990; Gürel, et al, 2022; Gürel, et al, 2003.

Informational roles are shaped in line with the CEO's notion of informing. In this context, it is possible to talk about role categories such as 'monitor', 'disseminator', 'spokesperson' and 'commander'.

Interpersonal roles represent the CEO's authority and responsibility in the communication process between people. Categories related to these roles can be detailed as 'leader', 'motivator', 'director', 'coach' and 'team leader'.

Decisional roles refer to the CEO's authority, duty, and responsibility for decision-making. Decisional role categories can be summarized as 'entrepreneur', 'employer', 'resource allocator', 'disturbance handler', 'conflict handler', 'taskmaster', 'negotiator', 'problem solver' and 'consultant'.

Operational roles represent the CEO's practical authority, duty and responsibility. Operational role categories can be described as 'organizer', 'analyzer', 'operator' and 'technical expert'.

Strategic roles express the CEO's authority, duty and responsibility for strategy development and implementation. It is possible to talk about strategic role categories such as 'coordinator', 'innovator', 'planner', 'strategist', 'tactician', 'visioner', 'change agent' and 'transformer'.

Diplomatic roles refer to the CEO's authority, duty and responsibility associated with diplomacy. Diplomatic role categories can be detailed as 'link/statesperson', 'figure-head' and 'liasion'.

Brand roles refer to the CEO's role, authority and responsibility associated with the organization's product and service brand and corporate brand. CEO within the scope of brand-based roles can act as a 'brand spokesperson' and 'brand ambassador', can be positioned as a

6th International CEO Communication, Economics, Organization & Social Sciences Congress

'CEO brand', and contribute to social responsibility projects on an individual and organizational level. Brand roles and role categories can be considered as relatively new duties and responsibilities in the literature (Gürel et al., 2002; Gürel et al., 2023).

Conclusion

It is essential that organizations are structured in line with strategic goals (Mintzberg, 2007). CEOs, who are the highest point of an organization, have duties, powers and responsibilities in many areas. The CEO, who has many duties in the organizational structure dynamics, is given authority and responsibilities. In this context, CEOs are expected to fulfill many managerial and operational responsibilities. According to the model of managing by Mintzberg, there are important qualities that managers should have. At the beginning of these are the skills in knowledge, people and action. With these characteristics, CEOs add value to their institutions by demonstrating their management skills, creating teams, motivating people and contributing to the development of organizational culture.

The CEO, who is the top manager of an institution, represents people who are equipped with the knowledge, skills and competencies that enable them to fulfill their duties, authorities and responsibilities. In this context, CEOs can be noted as a vitally needed position in all institutionalized organizations.

CEOs are in a multitasking structure by incorporating many roles. In this context, the CEO needs to be successful in multiple areas and integrate many features within themselves. In this context, CEOs are expected to be able to adapt to the requirements of the innovative, dynamic and modern world.

In this context, it is possible to state that CEOs are well-known people and brands. As a personal brand, CEOs have a role to make themselves and the organizations they manage known, visible and preferable within the framework of their powers, duties and responsibilities. In realizing these roles, it is important to fulfill the missions imposed on CEOs.

ÖZET

Teknolojik dönüşümün yaratmış olduğu ortamdan kültürel ürünler de etkilenecek dönüşüme uğramaktadır. Bu dönüşümün sonucunda ortaya çıkan tekno-kültür kavramı da teknolojinin kullanımının beraberinde kendini gösteren ürünleri ve bu ürünlere dair kullanım becerilerini açıklamaktadır. Bir tekno-kültür ürünü olarak ele alınması mümkün olan drone kameralar ise haberciliğe yeni bir soluk getirerek farklı tekniklerin haber üzerinde uygulanabilmesinin önünü açmaktadır. Drone habercilik, drone kameraların haberin toplanması aşamasında kullanılması ile kendini göstermekte ve bilinen anlamda haber kameralarının aksine kaydettiği görüntülerle habere dair farklı yorumlamaların yapılabilmesinin önünü açmaktadır. Sözü edilen faydalarına karşın bu kameraların günümüz habercilik faaliyetlerinde çok geniş şekilde yer tutmadığı görülmektedir. Çalışmada bu kapsamda drone kamera görüntülerini hem başka haber kaynaklarından temin ederek yayınlaması hem de “*NTV Drone Kamerası’nda*” başlığıyla kendi drone çekimlerini paylaşması sebebiyle NTV kanalında yayınlanan haberler ele alınarak incelenmeye tabi tutulmuştur. 1 Ocak 2023 – 1 Mart 2023 tarihleri arasında kanalın yayınlamış olduğu drone haber görüntüleri içerik analizi yöntemiyle analiz edilmiştir. Araştırma sonucunda drone kameraların ağırlıklı olarak deprem ve sel gibi doğal afet durumlarında daha fazla kullanıldığı ve klasik haber kameralarına kıyasla insan elinin erişemeyeceği yüksekliğe çıkarak görülmeyen farklı noktaları izleyicilere aktardığı saptanmıştır.

Anahtar Kelimeler: Drone Habercilik, Tekno-Kültür, Gazetecilik

The Use of Drone Cameras as a Techno-Cultural Tool in the News: The Example of NTV

ABSTRACT

Cultural products are also affected and transformed by the environment created by technological change. The concept of techno-culture, a result of this transformation, is also an explanation of the products created with the use of technology and the skills of use of these products. Drone cameras, which can be considered as a techno-culture product, bring a new breath to journalism and pave the way for different techniques to be applied on news. Drone journalism manifests itself in the use of drone cameras in news gathering, paving the way for different interpretations of the news with the images it captures, unlike cameras in the familiar sense. Despite these advantages, it can be seen that these cameras do not have a large place in today's journalistic activities. In this context, NTV was examined in this study because it both broadcasts drone camera footage from other news sources and shares its own drone footage under the title NTV Drone Camera. Between 1 January 2023 and 1 March 2023, the drone news images broadcast by the channel were analysed using a content analysis method. It was found that drone cameras are more likely to be used during natural disasters such as earthquakes and floods, and that they reach heights beyond the reach of human hands and transmit different invisible points to the audience compared to traditional news cameras.

Keywords: Drone Journalism, Techno-Culture, Journalism

GİRİŞ

Kültür, toplumdan topluma değişmekte olan öğretiler bütünü olarak ele alınabilmektedir. Toplumsal değişimin temel noktası içerisinde yer alan kültür, kayda değer derecede belirleyici olmaktadır. Kültürün durağan bir yapıda olmayışı, sürekli olarak kendini yenilemesine ve bağlı olduğu dönemin şartlarına göre biçim değiştirmesine sebep olmuştur. Bu doğrultuda kültüre birçok eklemeler yapılmış ve farklı açılardan incelenmesi mümkün olmuştur. Teknolojinin getirdiği dönüşüm de bu doğrultuda kültür üzerinde belirleyici olmuş ve tekno-kültür adı verilen yeni bir tür kültürün ortaya çıkışı gözlemlenmiştir. Tekno-kültür, kültürün teknoloji ile olan etkileşimi sonucunda kendini göstermiştir. Bu kültür, teknolojinin ortaya koyduğu cihazlarla değişen kullanım pratiklerini ve bu kullanım sonucunda değişen toplumsal ortamı anlatmaktadır. Teknolojiye bağlı olarak ortaya çıkan ürünler de tekno kültürün birer ögesi olarak değerlendirilmekte ve kültürel çerçevede incelenebilmektedir. Drone kameralar da teknolojinin ortaya koyduğu bir ürün olarak tekno-kültür aracı olarak değerlendirilebilmektedir.

Drone kameralar birçok alanda kullanılmakta ve insan gözünden farklı deneyimler sunmaktadır. Sözü edilen kameraların sahip olduğu görüş açısı, bilinen kameralardan farklı olarak işlemekte ve incelenen konuların daha geniş bir perspektiften ele alınmasını sağlamaktadır. Drone kameraların bununla birlikte insanın girmesinin yasak ya da tehlikeli görüldüğü yerlere de girmesi, bu kameraların birtakım alanlarda daha fazla yoğunlaşmış şekilde kullanımını getirmektedir. Bu alanlardan biri olan gazetecilikte, drone kamera görüntüleri kullanılmakta ve bu sayede farklı birçok konu haberleştirilme imkanı bulmaktadır.

Gazetecilikte drone kamera görüntülerine başvurulması, birçok farklı sebepten kaynaklı olabilmektedir. Ekonomik olarak daha uygun oluşu ve kolay taşınabilirliği sebebiyle bu kameralar maddi açıdan avantajlı olarak değerlendirilmektedir. Drone kameraların maddi avantajlarının yanı sıra haber görüntüsüne olan katkısı da bu kameraların kullanımı için haber merkezlerinde bir neden oluşturmaktadır. Drone haberlerin konusunun çok çeşitli olması, farklı haber deneyimlerinin de oluşmasını hem izleyici açısından hem de drone kullanan haber merkezi tarafından sağlamaktadır. Drone kullanımının kameramanlar tarafından yapılmaması gerekliliği, bu alanda uzmanlaşmış kişilerin de haber merkezlerinde istihdam edilmesini sağlamış ya da kameramanların yeni yetkinlikler kazanması için bir araç olmuştur.

Çalışma kapsamında incelenen NTV televizyon kanalı, farklı konularda drone haber görüntülerini kaydetmektedir. Kaydedilen drone görüntüleri, kanalın yayınlamış olduğu haberler içerisinde az bir yüzdeye sahip olsa dahi izleyiciler tarafından yüksek beğeni ve yorum sayılarıyla dönüşler alınmaktadır. Araştırmada elde edilen bulgular, özellikle doğal afet zamanlarında drone kameralara yönelik ihtiyacın artış gösterdiğini işaret etmiştir. Bu duruma örnek olarak Şubat ayında Türkiye’de Kahramanmaraş merkezli olarak gerçekleşen depremde ve sonrasında deprem bölgelerinde meydana gelen sel felaketinde kaydedilen görüntüler örnek olarak verilebilmektedir. Televizyon kanalının kendi drone kamerasını kullanması da drone haberlerde dışarıya bağlı kalmayıp kendi içeriklerini üretebilme ve izleyicilerle farklı tür haberleri paylaşabilme imkanı vermektedir. Bu doğrultuda drone haberlerin oluşumu esnasında hem birçok konu üzerinden haber oluşumunun gerçekleştiği hem de bu esnada farklı kaynaklara başvurulduğu görülmektedir.

TEKNO-KÜLTÜR ARACI OLARAK DRONE

En temel anlamıyla kültür, toplumların bir arada bulunmaları neticesinde ortaya çıkan ve o topluma özgü öğelerdir. Kültürün birçok ögesinin bulunması, birçok açıdan incelenebilmesinin önünü açmaktadır. Güvenç (1979: 95) kültürü aşağıdaki maddeler ile açıklamıştır:

- (1) Kültür, bir toplumun ya da bütün toplumların birikimli uygarlığıdır.
- (2) Kültür, belli bir toplumun kendisidir.
- (3) Kültür, bir dizi sosyal süreçlerin bileşkesidir.
- (4) Kültür, bir insan ve toplum teorisidir.

Clifford Geertz ise kültürün insanların iletişim kurma, sürdürme ve hayata karşı tutumlar hakkındaki bilgilerini geliştirme araçları olduğunu belirtmiştir (akt. Trompenaars ve Hampden-Turner, 1997: 24). Topluma ayna tutan ve toplumsal öğeleri yansıtan kültür, toplumsal değişim ve dönüşümün sonuçlarından da etkilenecek güncel olan tutumları açıklama eğilimindedir. Kültürün sahip olduğu çok çeşitli yapı, kavramın tanımının yapılması noktasında çok sayıda düşüncenin ortaya çıkmasını getirmiştir. Bireylerin ve toplumun zaman geçtikçe farklılık gösteren yapısının beraberinde kültür de farklılık göstermiş ve kendi içerisinde birtakım yollara ayrılmıştır.

Toplumsal değişimler üzerinde belirleyici bir etkisi olan ve giderek daha fazla alan içerisinde kendine yer bulan teknoloji olgusu, kültür üzerinde de benzer şekilde bir etki yaratmıştır. Bireylerin yaşamlarını kolaylaştırmak adına bir şeyler elde etmek, üretmek anlamlarına gelen teknik kavramı ile bilginin toplumsal bir anlam kazandığı teknoloji kavramı burada önem kazanmaktadır. Teknoloji, ortaya koyduğu birçok ürünün neticesinde toplumsal hayatı kolaylaştırmayı amaçlamaktadır. Teknolojinin kültürel öğeler içerisinde kendini giderek daha fazla göstermesinin neticesinde ise tekno – kültür adı verilen bir kavram kendini göstermiştir. Tekno-kültür kavramı, yeni medya teknolojilerinden bağımsız düşünülemez ve değişimini sürdüren kültürel bir iklime işaret etmektedir (Seylan & Güney, 2016: 97). Teknolojinin ortaya koymuş olduğu cihazların toplumdaki kullanım pratiklerini değiştirmesi ve toplumsal dönüşümü sağlamasının beraberinde toplumu tanımlayan öğelerden biri olan kültür de teknolojik bir hal almıştır.

Cooper, tekno-kültür kavramının tarihçesini Heidegger, Benjamin ve İtalyan Futurizmi'ne kadar götürürken Ross, 1939 New York Dünya Fuarı ve General Motors'un yeniden yapılanmış olan kenti otomobil endüstrisine göre tasarlama niyetine kadar götürmektedir (Akşit, 2011: 2). Geneli itibariyle teknokültür, teknolojinin ilerleme gösteren yapısına vurgu yapmaktadır. Teknolojinin kendini geliştirmesi ve çok yönlü bir şekilde ilerleme kaydetmesinin beraberinde toplumun her alanında kendisini göstermiş ve toplumsal birçok konuda etki sahibi olmuştur. Teknolojinin dünya üzerindeki her ülkede dengeli bir şekilde dağılım göstermediği ve bu yönüyle dijital uçuruma sebep olduğu düşünüldüğünde tekno-kültürün de kültürün temelinde yer alan farklılık olgusu gibi bir olguya sahip olduğu görülmektedir. Castells (2008: 6), teknolojinin toplumu temsil ettiğini ve toplumun teknoloji olmadan anlaşılmasının zor olduğunu belirtmekte, bu yönüyle de tekno-kültür kavramına da bir açıklık getirmektedir. Toplum – teknoloji – kültür üçgeninde gerçekleşen ilişki sonucunda ortaya çıkan tekno-kültür kavramı teknolojinin geldiği noktada gücünü gösterir niteliktedir. Tekno – kültür araçları ise teknolojinin gelişimi ile kendini gösteren ve toplum üzerinde bir etki yaratan araçlar olmaktadır. Yeni medya aracı olarak tanımlanan araçlar aynı zamanda tekno – kültür aracı olarak da değerlendirilebilmektedir. Drone kameralar da teknolojinin gelişiminin beraberinde ortaya çıkan ve toplumun üzerinde etki yaratan bir araç olarak tekno – kültür içerisinde değerlendirilebilmektedir.

Drone kameraların kullanımı, günümüz teknolojisinin sunmuş olduğu alt yapılar ışığında sıklıkla kendini göstermektedir. Sözü edilen kameraların kullanıldığı ilk yıllar ise uzun bir geçmişe sahiptir. Uçak (2020: 67), drone kullanımının ilk olarak 1800'lü yıllarda ortaya çıktığının varsayıldığını belirtmiştir. Birinci Dünya Savaşı yılları ise drone kameralar, ağırlıklı

olarak gözetimi sağlamaya olanak tanıyan bir araç olarak tasarlanılarak geliştirilmiştir. Benzer amaçlarla İkinci Dünya Savaşı'nda da kendini gösteren bu hava araçları, ABD ve SSCB arasında bir istihbarat aracını dönüşmüştür. Japonya ise İkinci Dünya Savaşı sırasında bomba taşıyan drone'ları faaliyete geçirmiştir (Garamone'den akt. Budak, 2019: 121). Bu noktadan itibaren drone kameralar daha fazla yaygınlaşmış ve ilk kullanıldığı döneme kıyasla daha çeşitli amaçlar için hizmet vermeye başlamıştır.

DRONE GAZETECİLİĞİ

Drone gazeteciliği, drone adı verilen kameralar aracılığıyla gazetecilik faaliyetlerinin gerçekleştirilmesi sonucunda ortaya çıkmaktadır. İngilizce sözlüklerde “erkek arı” ya da “vızıltı” anlamına gelen drone kelimesinin Türkçe kullanımı farklılık göstermektedir. Drone kelimesinin Türkçe’de kullanımı için Türk Dil Kurumu (TDK) tarafından “uçangöz” kelimesi önerilmiş, BBC ise drone’un yanı sıra ‘uçan kameralar’ veya ‘robot’ kelimesini kullanmıştır (Şahin, 2018: 185). Bu kavramın ayrıyeten günümüzde insansız hava aracı ya da uzaktan kumandalı hava aracı olarak da tanımlanabilmesi mümkün olmaktadır. Drone terimi, dünyayı gözlemlemede ve onunla etkileşimde benzeri görülmemiş bir özgürlüğe izin veren sensörlerle uçuşları birleştiren bir robot olan insansız hava aracı olarak bilinmektedir (Ferdinandez'den akt. Patabandige, 2019: 229). Bir kişi ya da kuruluş tarafından kontrol edilebilen bu araçlar, askeri amaçla kullanıldığı gibi çeşitli spor müsabakalarında, doğal afet durumlarında, habere konu olan olaylarda ya da hobi amacıyla da kullanılabilir. Kavaklı (2018: 161), günümüzde erişilebilirlik ve kullanım konusunda daha kolay bir hale gelen drone kameraların güvenlik, keşif, gözetim, teslimat, ulaşım, yardım amaçlı kullanımlarının bulunduğunu belirtmiştir. Drone kameraların üretiminde yaşanan değişimler, sözü edilen araçların giderek daha fazla amaç için kullanılmasının da ayrıca önünü açmaktadır.

Drone kameraların bilinen anlamda kameralardan farkının anlaşılmasının beraberinde habercilikte kullanılması söz konusu olmuştur. Drone'lar, haber içeriğindeki artırılmış gerçeklik, sanal gerçeklik ve karma gerçeklik (artırılmış gerçeklik ve sanal gerçekliğin bir birleşimidir) uygulamalarının geliştirilmesi dahil olmak üzere, sürükleyici haber içeriği üretiminin geliştirilmesinde giderek daha merkezi bir rol oynamaktadır (Pavlik, 2020: 137). Drone kameraların ilk olarak savaş yıllarında kullanılması bu kameraların daha çok ilgili alanlarda örneklerinin verildiğini düşündürse de gazetecilik alanında kullanılan drone kameralar bu pratiklerden farklı ilerlemektedir. Gazetecilik dronları ise tam tersine, silahlar veya bombalarla donatılmamış, ancak daha önce bilinmeyen açılardan alanların, insanların ve eylemlerin hava fotoğraflarını ve videolarını çekmeyi amaçlayan yüksek çözünürlüklü kameralar ve sensörlerle donatılmıştır (Gynnild, 2014: 337). Bu noktada drone haberciliğinin drone kameraların geliştirilmiş teknolojilerle olan ilişkisinin bir sonucu olduğu söylenebilir.

Drone kameraların muhabirlerin ya da kameramanların ulaşamadığı yerlere girmesi ve haber toplama yöntemlerini genişleterek yeni tür haberler ortaya koymasının beraberinde drone gazeteciliği adı verilen bir gazetecilik kendini göstermiştir. Drone gazeteciliği, haber toplamada genellikle drone olarak adlandırılan insansız hava araçlarının (İHA'lar) kullanılmasından oluşmaktadır (Pérez-Seijo & Vicente, 2022: 46). Drone Gazeteciliği Laboratuvarı'nın kurucusu Nebraska Üniversitesi'nden Matt Waite ise benzer şekilde drone'u “gazetecilikte fotoğraf, video ve veri toplamak için küçük bir insansız hava aracı” olarak tanımlamaktadır (Whitaker'den akt. Budak, 2019: 121). Drone kameraların gazetecilikte kullanımı bilinen anlamda bir kamera kullanımından belirgin şekilde ayrılmaktadır. Bilinen kamera açısından farklı yakaladığı görüntülerle drone kameraları, haber toplamak amacıyla

birçok farklı haber merkezi tarafından kullanılmaktadır. Drone kameraların gazetecinin görüşüne olan etkisi aşağıdaki şekilde görselleştirilmiştir:

Figür 1: Bir Drone'un Gazetecilik Vizyonunu Genişletme Yeteneği
(Heaton vd., 2018)

Dünya çapında birçok haber merkezi farklı amaçlar doğrultusunda drone kullanımına yönelmiştir. Protestolar, sel, yangınlar, savaş ve su altı operasyonları gibi haber olayları, muhabirlerin kullanımına sunulan insansız hava araçlarıyla olağanüstü şekillerde ele alınabilecek olayların yalnızca küçük bir parçasını temsil etmektedir (Gynnild & Uskali, 2018: 1). Drone kameralar her ne kadar birçok alanda uzun süredir gelişim gösteriyor olsa da drone gazeteciliğinin kullanımı 2000'li yılların başına dayanmaktadır. Goldberg (2018: 36), drone gazeteciliği kavramının ilk olarak 2002 yılında The Poyn ter Institute for Media Studies'de insansız hava araçlarının raporlama ve araştırma için etik ve pratik kullanımına bakan Larry Larsen tarafından keşfedildiğini açıklamıştır. Türkiye'de gazetecilikte drone kullanımıyla ilgili ilk görüntüleri DHA paylaşmıştır. Günümüzde gelinen noktada ise birçok haber ajansı ve gazete haberlerinde drone kameralar aracılığıyla çekilmiş görüntülere yer vermektedir. Drone kameraların habercilikte kullanımı olumlu ve olumsuz birçok durumu bir arada barındırmaktadır. Drone görüntülerinin gazetecilik açısından önemini anlamak için, öncelikle drone gazeteciliğinin, dünyadaki olay ve durumların yetkili açıklamalarını sağlamak olan gazeteciliğin normatif rolüne nasıl yardımcı olduğunu belirlemek gerekir (Barnhurst & Nerone'den akt. Hamilton, 2020: 65). Özellikle doğal afetlerin yaşandığı bölgelerde girilmesi güç olan bölgelere herhangi bir zorlama olmadan girebilen bu cihazlar, gazetecilik pratiklerini iyileştirmekte ve daha kesintisiz bir haber anlayışını sunmaktadır.

Kavaklı (2018: 163 – 165), drone'ların gazetecilik alanına sunmuş olduğu olanakları dört temel düzeyde açıklamıştır:

1. Haber toplamaya dair pratikleri kolaylaştırarak güçlendirmesi,
2. Haberin içeriğinin güçlenmesine ve haberin anlatımına dair avantaj sunması,
3. Alternatif medyaya ve gazetecilik pratiklerine yeni kanallar sunması,
4. Ekonomik oluşu.

Gynnild (2014: 338) ise drone teknolojilerinin göreceli avantajını üç başlık altında toplamıştır:

1. İş modellerini iyileştirmesi,
2. Gazetecilik çalışma koşullarının iyileştirilmesi,

3. Bir ürün olarak gazeteciliğin kalitesinin iyileştirilmesi.

Drone kameralarının boyutunun oldukça küçük oluşu sayesinde muhabir ya da kameramanların girmesinin zor olduğu ya da tehlike barındırdığı noktalara kolaylıkla ulaşabilmesi ve 2-5 metre arasında bir yakınlaştırma yapmaya imkan sunması bu teknolojileri var olan diğer kameralardan ayırmaktadır. Özellikle çok kısa sürede hızlı bir şekilde yukarı çıkabilmesi, herhangi bir tehlike anında en az miktarda zararın oluşumunu getirmektedir. Bu özellikleri neticesinde drone kameralara sel, deprem, tsunami, yangın, heyelan gibi doğa olaylarında sıklıkla başvurulduğu görülmektedir.

Drone kameralar sunmuş oldukları bakış açısı, görsel haber anlatımını da zenginleştirmiştir. Farklı bakış açılarını sunması ve bu bakış açılarının medya şirketine daha az maliyetli oluşu bu teknolojinin kullanımının artışı getirmektedir. Kolay taşınabilen, herkes tarafından ulaşılabilen ve satın alınabilen drone'ların üretilmesi ile birlikte gazetecilik alanında drone'ların kullanılması yükselişe geçmiştir (Fernández Barrero, 2018: 40). Drone'lar sahip oldukları bu avantajlarıyla birlikte tehlikeli ortamlarda haberlerin toplanma sürecine de etki etmektedir. Bu sayede gazetecilerin volkanik patlamalar, savaşın yitdiği köyler ve doğal afetler gibi haber olaylarının görüntülerini çekmesini sağlanmaktadır (Okocha vd. 2021: 3). Drone kameraların uçak ya da helikopter desteği olmaksızın kullanılabilir oluşu da benzer şekilde haber merkezlerine minimum risk ile profesyonel çekim yapabilme imkanını sunmaktadır.

Sahip olduğu avantajlara karşın drone kamera kullanımının beraberinde getirmiş olduğu birtakım riskli durumlar da kendini göstermektedir. Özellikle kalabalık bölgelerde drone kullanmanın dezavantajı, tepeden bakmak için gönderildikleri vatandaşların üzerine düşebilmeleridir (Jarvis, 2014: 9). Drone kameraların oldukça küçük oluşu sebebiyle kişiye özel alanlara da girebilmesi, özel hayatın gizliliğine dair soru işaretlerini de ortaya çıkarmıştır. Bu durum birçok ülkede drone kameraların belirli kısıtlamalara tabi tutulmasını gerektirmektedir. Örneğin Finlandiya mevzuatı, ev içi binalarda veya mesken kullanımına yönelik binalarda herhangi birinin teknik bir cihaz yardımıyla izlenmesini veya izlenmesini yasaklamaktadır (Lauk vd. 2016: 119). Bu sebeple drone kameralar her ne kadar büyük avantajlar sunmuş olsa da bu avantajların kişi haklarını tehlikeye atmayacak şekilde kullanılması gerekli görülmektedir.

Sunmuş olduğu avantajlar ve ortaya çıkması muhtemel olan riskler beraber değerlendirildiğinde bu tür bir gazeteciliğin etik açıdan da değerlendirilmesinin yapılması gerekli görülmektedir. Kimi ülkeler, drone kullanımını hukuki açıdan birtakım kurallara da bağlamıştır. Drone gazeteciliğinde güvenlik gereklilikleri (aynı zamanda bir hobi olarak drone uçuşu) evrenseldir. Dronlar nispeten kısa ömürlü pillere güvendiğinden, drone bir kalabalığın üzerinde uçarsa ve pil biterse yaralanma riski bulunmakta olduğundan, mevcut düzenlemelerin çoğu toplu toplantılar, sokak gösterileri veya spor etkinliklerini kaydetmek için dronların kullanılmasını yasaklamaktadır (Lauk vd. 2016: 120).

Drone kullanımını kimin gerçekleştireceği konusu ise birtakım kurallar çerçevesinde işleyiş sağlamaktadır. Ağırlığı 500 gram ve üstü olan drone kameraları satan, alan, üreten, ithal eden ve uçuran herkesin Sivil Havacılık Genel Müdürlüğü sistemi üzerinden kayıt işlemi yapmaları zorunlu tutulmuştur (Uçak, 2020: 70). Bununla birlikte ağırlığı 500 gram üzeri olan cihazların da eğitim gerekliliklerini tamamlamaları zorunlu tutulmaktadır.

ABD'de bulunan Profesyonel Gazeteciler Birliği Etik Komitesi başkanlığı, drone kullanan haber merkezlerinin kendi iç etik kurallarını belirleyerek hangi durumlarda drone kullanımının gerçekleştirileceğinin kurallara bağlanmasını belirtmiştir (Kavaklı, 2018: 166). Drone kullanımı sırasında bu noktada bilinen gazetecilik etik kurallarına benzer şekilde kamu yararı, doğru ve güvenilir haber verme prensiplerinin benimsenmiş olması beklenmektedir.

Türkiye’de de benzer şekilde izinsiz drone kullanımı her ne sebeple olsun yasaklanmakta ve drone kullanımlarının kayıt altına alınması beklenmektedir.

Drone kameraların kullanımı standart bir kamera / video kullanımının dışında olmaktadır. Özellikle haber alanında drone kullanımı için çeşitli eğitimlerin alınması zorunlu tutulmaktadır. Bu tür eğitimler kişilerin bireysel olarak sertifika programları aracılığıyla alınabiliyorken aynı zamanda iletişim fakültelerinde ders olarak da verilmeye başlanmıştır. Örneğin Drone gazeteciliği için Nebraska Üniversitesi’nde Profesör Matt Waite tarafından bir drone gazeteciliği laboratuvarı da kurmuştur. Burada, drone gazeteciliği için gerekli eğitim ve kurslar verilmekte ve drone haberciliği üzerine araştırmalar yapılmaktadır (Budak, 2019: 122). Benzer şekilde farklı ülkelerdeki üniversitelerde de drone eğitimlerinin verildiği görülmektedir. ABD’de bulunan birkaç gazetecilik okulu drone gazeteciliği adı altında bölümler oluşturmuştur. Bununla birlikte Nebraska-Lincoln Üniversitesi, Kasım 2011 tarihinde gazeteciliği daha fazla dijital ve yenilikçi bir hale getirmeyi amaçlayan Drone Gazetecilik Laboratuvarı’nı kurmuştur (Uçak, 2020: 71). Türkiye’de ise drone gazetecilik dersleri iletişim fakültesi müfredatlarında henüz yeni yer almaya başlamış ve bu alandaki dersler ağırlıklı olarak seçmeli olarak okutulmaktadır.

Araştırma

Araştırmanın Amacı ve Yöntemi

Bu araştırma, drone haberciliğin günümüzde ne şekilde kullanıldığını ölçmeyi amaçlamıştır. Günümüzde drone habercilik hem basın organlarının ajanslardan servis aldığı görüntüler üzerinden ilerlemekte hem de kendilerinin drone kameralarıyla çektiği görüntülerden oluşmaktadır. Bu kapsamda drone haberciliğin kendini göstermesi iki başlık altında değerlendirilebilmektedir. Drone haberciliğe dair gerçekleştirilen araştırmada aşağıdaki sorulara cevap aranmıştır:

1. Drone haberciliğin aylara göre dağılımı nasıl ilerlemektedir?
2. Haber kanallarının drone haber videolarına karşılık aldığı beğeni/yorum oranları ne şekilde olmaktadır?
3. Drone haber kaynakları nasıl bir dağılım izlemektedir?
4. Drone haberler ağırlıklı olarak hangi konularda verilmektedir?
5. Drone haberlere konu olan bölgeler nasıl farklılaşmaktadır?

Çalışmanın sorularına yanıt vermesi açısından NTV kanalının YouTube hesabına yüklediği haberler incelenmiştir. Haberlerin incelenmesi esnasında çalışmanın sorularına yanıt vermesi önemli görülmüş ve bu şekilde bir inceleme gerçekleştirilmiştir. Araştırmada içerik analizi yöntemi kullanılmıştır. Çalışma kapsamında drone haberlerin incelenmesi için nicel içerik analizine başvurulmuştur. İçerik analizi, iletişim içeriğini kategorize edip sonrasında ilgili kategoriler arasında kendini gösteren ilişkiselliği sistematize bir şekilde tanımlayan bir yöntemdir (Riffe, Lacy ve Fico, 2005: 3). İçerik analizi sonucunda elde edilen bilgiler, araştırmanın hedeflediği amaca ve yanıt aramak istediği sorulara yönelik derlenerek tablolaştırılmıştır.

Araştırmanın Evren ve Örneklemi

Araştırmada drone haberlerin kaynaklarının dağılımının ne şekilde incelendiğine yönelik oluşturulan soruya yanıt vermesi açısından örneklemin hem kendi drone kamerasıyla haber çekimi yapmış olması hem de ajanslardan gelen drone görüntülerini paylaşmış olması önemli görülmüştür. Buna ek olarak, araştırma YouTube üzerinden yüklenen videolara dair bir analizi

içereceğinden dolayı örneklemin YouTube hesabının olması gerekliliği önem kazanmıştır. Yapılan incelemelerde birçok televizyon kanalının dışarıdan drone görüntülerini servis ettiği anlaşılmış ve araştırmanın her iki koluna da örnek verebileceği sebebiyle NTV seçilmiştir. NTV YouTube hesabı hem ajanslardan alınan görüntülere yer verirken hem de “NTV Drone Kamerası’nda” başlığıyla kendi videolarını paylaşmaktadır.

Araştırmanın Bulguları

Tarihler	Paylaşılan Toplam Haber Sayısı	Paylaşılan Drone Haber Sayısı	Toplam Haber İçerisinde Drone Haberlerin Oranı
Ocak 2023	156	7	%4,48
Şubat 2023	225	35	%15,55
Mart 2023	143	19	%13,28

Tablo 1. NTV’de Yayımlanan Drone Haberlerin Aylara Göre Dağılımı

NTV’de yayımlanan drone haberler toplam paylaşılan haberlere kıyasla oldukça az yer kaplamıştır. Drone haberlerin sayısı, toplumda o dönemde ortaya çıkan olaylara göre değişim göstermektedir. 6 Şubat tarihinde Kahramanmaraş merkezli olarak gerçekleşen ve beraberinde birçok ili etkisi altına alarak çok sayıda can ve mal kaybına neden olan depreme dair görüntüler drone kameralarıyla görüntülenerek paylaşılmıştır. NTV’nin drone haberlerinin daha çok Şubat ayında paylaşılmasının nedenlerinden biri olarak bu durum ön plana çıkmaktadır. Ocak 2023 tarihinde paylaşılan haberler ağırlıklı olarak çevre ve iklim konularına odaklanırken Şubat ayı itibarıyla ağırlıklı olarak deprem bölgesinden haberler verilmiştir. Mart ayı itibarıyla de bir önceki ay yayımlanan içeriklere ek olarak iklim ve doğa olaylarının yaratmış olduğu durumlarla ilgili drone haber görüntülerine yer verilmiştir.

Tarihler	Drone Haberlerin İzlenme Sayısı	Drone Haberlerin Beğeni Sayısı	Drone Haberlerin Beğenilmeme Sayısı	Drone Haberlere Gelen Yorum Sayısı
Ocak 2023	7.787	77	-	24
Şubat 2023	1.772.919	3.769	-	846
Mart 2023	62.635	331	-	74

Tablo 2. Drone Haberlerin Aylara Göre Etkileşim Sayıları

NTV, Şubat ayında en fazla haberi yüklediği gibi aynı zamanda bu tarihte en yüksek izlenme, beğeni ve yorumu da almıştır. Drone haberlerin izlenme oranı üç aylık periyot göz önüne alınarak incelendiğinde yüksek olduğu görülmektedir. Drone görüntüler; kullanıcıların izlediği, beğendiği ve yorum yaparak görüşlerini paylaştığı bir noktada durmaktadır. Drone haberlerin bir ortak noktası ise hiçbir şekilde beğenilmeme sayısının olmayışındadır. Bu noktada drone haber görüntülerinin kullanıcıların ilgisini çektiği görülmektedir.

Drone Haber Kaynağı	Paylaşılan Drone Haber Sayısı
NTV Drone Kamerası	29
AA	22
DHA	10
İHA	1
Yurtdışı Kaynaklar	-

Tablo 3. Drone Haber Görüntülerinin Kaynakları

Drone haber görüntüleri, ağırlıklı olarak televizyon kanalının kendi drone kamerasıyla kaydedilmiştir. Bu durum, çalışmada NTV'nin seçilmesine de bir dayanak noktası oluşturmaktadır. “*NTV Drone Kamerası'nda*” başlığıyla çekilen görüntüler televizyon kanalının kendi bünyesinde üretilerek sunulmaktadır. Sözü edilen çekimler dışında kaydedilen görüntüler ise ağırlıklı olarak haber ajanslarından gelmektedir. Yurtdışı kaynaklı olarak hiçbir drone görüntüsünün servis edilmediği görülmekte ve yurtiçinde görüntü alınan ajanslardan alınan haberlerin de birbirlerinden farklı sayılarda olduğu görülmektedir.

Drone Habere Konu Olan Haber Türü	Drone Haberin Sayısı
Deprem	42
Çevre	9
İklim	4
Dünya	3
Sel	2
Bilim / Teknoloji	1
Yangın	1

Tablo 4. Drone Habere Konu Olan Haber Türleri

Drone haberlerin sayısı Şubat ayında artış göstermiş ve izlenme oranı da bununla paralel olacak şekilde belirgin düzeyde farklılaşmıştır. Özellikle 6 Şubat 2023 tarihinde meydana gelen Kahramanmaraş merkezli depremin sonucunda çekilen görüntülerin yayınlanması ve depremin etki ettiği diğer illerden de görüntülere yer verilmesi sebebiyle drone haberler ağırlıklı olarak deprem konusunda olmuştur. Bununla birlikte özellikle Ocak 2023 tarihinde televizyon kanalının çevre konusuna dair birçok haber ürettiği de görülmektedir. Depremin ardından yaşanan aynı bölgede yaşanan sel de drone kameralarda kaydedilerek izleyicilerle paylaşılmıştır. Deprem ve sel gibi durumlarda özellikle bir kişinin girmesinin sakıncalı görüldüğü yerlerde drone kameralar yol gösterici bir nitelik kazanmış ve hem girilemeyen evlerin içine girerek görüntülerini kaydetmiş hem de depremin yaratmış olduğu etkinin havadan görülebilmesini sağlamıştır.

Drone Kameraların Kullanıldığı Şehirler	Paylaşılan Drone Haber Sayısı
Hatay	18
İstanbul	9

Kahramanmaraş	9
Malatya	7
Adıyaman	6
Gaziantep	4
Şanlıurfa	2
ABD	2
İsrail	1
Batman	1
İzmir	1
Kocaeli	1
Elazığ	1

Tablo 5. Drone Kameraların Kullanıldığı Şehirler

NTV, Şubat ayında paylaştıkları haberlerinde ağırlıklı olarak depremin ortaya çıktığı bölgede ya da depremin etki ettiği çevre illerde görüntü kaydetmiştir. Bu sebeple en çok Hatay'da drone kameraların kullanıldığı haberler paylaşılmış ve Kahramanmaraş, Malatya, Adıyaman, Gaziantep, Şanlıurfa illerinden de çoğunlukla deprem görüntülerine yer verilmiştir. Yurt dışında kaydedilen drone görüntüler, televizyon kanalının Türkiye'de bulunan ajanslardan aldıkları görüntülerden oluşmaktadır. Buna göre televizyon kanalının drone haberciliği gerçekleştirirken sınırlı kaynaklardan yararlandığı görülmektedir.

SONUÇ

Uçan kamera ya da tepegöz olarak adlandırılan ve farklı şekillerde tanımlanan drone kameralar, hem geçmişte hem günümüzde birçok farklı alanda kullanılmıştır. Bu kameraların bilinen anlamda kameralardan farklı olarak insanın erişemeyeceği noktalara erişmesi ve hem insan gözünün hem de klasik kamera objektifinin sunduğu görüntüden farklı bir görüntü sunması sebebiyle farklı amaçlı kullanımlara sahip olmaktadır. Drone kameraların gazetecilikte kullanımını sonucunda da haberciliğe farklı bir alan eklenmiş ve drone gazeteciliği adı verilen bir uzmanlık alanı ortaya çıkmıştır.

Drone gazeteciliğin temelinde kameraların ulaşamadığı ya da kişilerin güvenliğinin riske atıldığı yerlerdeki olayların haberleştirilmesi ve farklı bir bakış açısı sunarak olayları aktarması yatmaktadır. Drone kameralar, bilinen kameralara oranla daha pratik ve daha ekonomik olsa da bu kameraların kullanılması için çeşitli yeteneklere de ayrıca sahip olunması gerekmektedir. Görsel olarak farklı bir deneyim imkanı sunan drone kameralar, her kameramanın kullanabileceği bir cihaz olmayışından dolayı her haber merkezine de girmemektedir. Özellikle küçük boyutlarından dolayı kişilerin özel hayatlarını ihlal edecek alanlara girebilme ya da kullanımının bilinçsizce yapılması sonucunda birçok kişiyi yaralama ihtimalleri, bu cihazın kullanımının dikkatli ve eğitilmiş kişiler tarafından yapılmasını gerekli kılmıştır.

Çalışma kapsamında NTV kanalının YouTube hesabında paylaştığı drone haber görüntüleri içerik analizi yöntemiyle incelenmiştir. Gerçekleştirilen inceleme sonucunda drone haber görüntülerinin özellikle doğal afet durumlarında önem kazandığı saptanmıştır. Öyle ki kanalın YouTube sayfasında yayınlanan içeriklerden en fazla etkileşim oranını Şubat ayında gerçekleşen depreme dair kaydedilen drone görüntüleri almaktadır. Drone görüntüleri incelendiğinde farklı birçok konunun habere dahil edildiği görülmektedir. Deprem sonrası vatandaşların girmesi riskli kabul edilen binalara giren drone kameraları evlerin içini göstermek adına kullanılması ya da tepeden çekilen görüntülerle farklı şehirlerde depremin ortaya çıkardığı durumu göstermesi sebebiyle drone kameralar kullanılmıştır.

Drone kameraların özellikle doğal afet durumlarında kaydettiği görüntüler incelendiğinde sıradan bir kameranın, bir muhabir ya da bir kameramanın girmesi mümkün olmayan alanlar içerisinde kendini gösterdiği görülmektedir. Yıkılma riski olan binalar ya da sel basma tehlikesi olan yolların tümü hem ajanslardan alınan drone görüntüleriyle hem de televizyon kanalının kendi drone kameralarıyla görüntülenmiştir. Yurtdışında gerçekleşen olaylara dair alınan görüntüler de sadece Türkiye’de var olan haber ajanslarıyla sınırlı kalmaktadır. Drone haberlerinin yayılımının genişletilmesi ve kullanıcılara sunulması açısından farklı ülkelerin kendi drone görüntülerinin de paylaşılmasının bu habercilik türünün gelişimini sağlayacağı düşünülmektedir.

Drone kamera görüntülerinin kullanıcılar tarafından da ilgiyle takip edildiği görülmüştür. Buna göre kullanıcılar, drone kamera görüntülerinin artmasına paralel şekilde izleme oranlarını ve yorum sayılarını artırmıştır. Drone kamera görüntülerinin hiçbir şekilde beğenilmeme sayısının olmayışı da kullanıcıların bu görüntülere olan ilgisini açıklar niteliktedir.

ABSTRACT

This study investigates customer purchase intentions for traditional life insurance products, focusing on the impact of financial literacy. It investigates the specific challenges faced by Life Insurance Companies in Indonesia due to tightening regulations imposed by Indonesia's Financial Services Authority ("OJK") regarding unit-link Insurance Products, a modified Whole Life Insurance Product that combines protection and investment. As a result, Life Insurance Companies have recently competed to supply traditional life insurance products to ensure company continuity. By addressing the need for more research in this area, this study fills a void by informing Life Insurance Companies on how financial literacy influences consumer purchase intentions of traditional life insurance products.

This study gives a thorough knowledge for Life Insurance Companies to establish ways to learn more about consumer behavior in the emergence of various traditional life insurance products through a synthesis of existing literature, qualitative research findings, and empirical evidence. The suggested research framework emphasizes critical characteristics of financial literacy, attitude, subjective norm, perceived behavior control, and their impact on customer purchase intention of traditional life insurance products.

While this conceptual article provides valuable insights and a research framework, a more empirical study is required to validate and expand on the offered claims. Future research should look into the impact of financial literacy on consumer purchasing intentions, particularly among Generation Z.

This study will benefit others, mainly by providing insights to the boards of management of Life Insurance Companies in understanding the consumer intention of the Traditional life insurance product, particularly in understanding the shift from unit-link Life Insurance products to Traditional life insurance products.

Keywords: Financial Literacy, Purchase Intention, Life Insurance

1. INTRODUCTION

Life insurance is a financial instrument that individuals acquire to protect themselves and their families against unanticipated risks with financial repercussions. Additionally, life insurance is a solid foundation for complete financial planning and is particularly important for households with young children. Simply put, consumers contribute a certain amount each period to their "savings accounts" or life insurance policies, which serve as collateral for loans. Life insurance policies have evolved to provide additional conveniences and a safety net for consumers, such as coverages for unintentional risks like incapacity for employment or accidental death, after which the company pays them a sum of assured benefits.

The development of the Insurance Industry itself in Indonesia within ten past years is increasing, especially life insurance, which annually contributes premiums of dozens or hundreds of trillion IDR. Even recorded in 2021, there is an exceptional contribution of IDR 203 trillion by predominance 62,9% contribution or equivalent IDR 127,7 trillion comes from Unit Link Life Insurance Products, which growing 6,4 % from 2020, and the remaining 37,1 % comes from Traditional Life Insurance Products (2022, Source Data AAJI).

Various studies have stated that financial literacy is one factor that needs attention in advancing the life insurance industry, one of which is the study conducted by Wang et al. (2020). The study was conducted in China and concluded that an increase in the financial literacy index would impact the premium income of the life insurance industry. In the Indonesian context, these findings are pretty related to the results of the National Financial Literacy and Inclusion Survey conducted by the Financial Services Authority in 2019, where the insurance sector literacy index is still far below the banking literacy index and even the overall financial literacy index, while the penetration rate is still stagnant. Indonesia's financial literacy index in 2019 continues to increase compared to previous surveys conducted in 2013 and 2016. In 2019, the financial literacy index reached 38.03%, an increase of 16.19% from 2013.

In 2021, the public was enlivened by customer complaints due to unit-linked Life Insurance products. In marketing, agents tempt large investment profits to customers, but in practice, many customers experience losses. Simply put, unit-linked insurance can be a life insurance product linked to an investment and provides two benefits in one policy: protection and investment benefits. The investment benefits offered by this product have risks according to the type of investment chosen.

Departing from the many customer complaints, Otoritas Jasa Keuangan (OJK) issued new regulations regarding investment-linked insurance products, which is unit-link. This new regulation will tighten the process of selling products to report product performance to its customers. In this rule, OJK focuses on transparency in unit-link sales, including the after-sales service. In addition, customers should be educated enough to compare which insurance product is better, buy a package of protection and investment together (unit-link) or buy it separately between traditional life insurance products and investment products alone, which all of these have a strong relationship with customers' financial literacy.

Due to tightening regulations from the OJK regarding unit-link Insurance Product a modified of Whole Life Insurance Product which combined between protection and investment, life insurance companies have recently been competing to issue traditional life insurance products as a form of anticipation to maintain business continuity.

However, with the emergence of many traditional life insurance products, do people already have sufficient financial literacy to know enough to differentiate which insurance product is best for customers, be it a unit-linked life insurance product or a traditional life insurance product? Suppose the public already has sufficient financial literacy and understands the latest OJK regulations regarding unit-linked life insurance. Will there be an increase in purchasing intentions for traditional life insurance products?

This research will employ a modified version of Ajzen's (1991) model of the theory of planned behavior to assess financial literacy as a factor influencing customer purchase intention of traditional life insurance products (TPB). The TPB was used for this research because it evaluates numerous personal and environmental aspects influencing consumer purchasing intention. TPB will measure customer intent to acquire traditional life insurance products by predicting consumer attitudes, subjective norms, and perceived behavioral control.

Therefore, this research will address this gap by investigating the influence of financial literacy to consumer purchase intention of traditional life insurance product

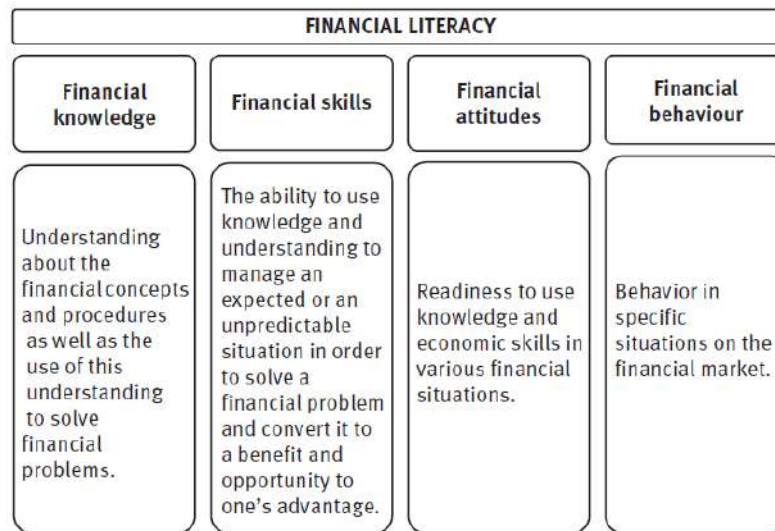

This research is formulated to understand the factors influence the consumer's purchase intention with the following six research questions:

1. What is the effect of Consumer Attitude (ATT) to Purchase Intention of Traditional Life Insurance Product (PI)?
2. What is the effect of Consumer Subjective Norm (SN) to Purchase Intention of Traditional Life Insurance Product (PI)?
3. What is the effect of Consumer Perceived Behavioral Control (PBC) to Purchase Intention of Traditional Life Insurance Product (PI)?
4. How Financial Literacy (FL) would affect the relationship between Consumer Attitude (ATT) to Purchase Intention of Traditional Life Insurance Products (PI)?
5. How Financial Literacy (FL) would affect the relationship between Consumer Subjective Norm (SN) to Purchase Intention of Traditional Life Insurance Products (PI)?
6. How Financial Literacy (FL) would affect the relationship between Consumer Perceived Behavioral Control (PBC) to Purchase Intention of Traditional Life Insurance Products (PI)?

2. LITERATURE REVIEW

2.1 FINANCIAL LITERACY

Chen and Volpe (1998) define financial literacy as the knowledge to manage finances in financial decision-making. A lack of financial literacy causes a person to be more likely to have problems with debt, be more involved with higher credit costs, and less likely to plan for the future (Lusuardi et al., 2010). Hilgert et al. (2003) and Cude et al. (2006) also stated that knowledge of how to manage finances and how the technique in investing must be addressed as in previous times.

Elements of Financial Literacy

Source: Beata Swiecka, 2019

Financial literacy consists of the following elements (see Figure 2.1)

- a. Financial knowledge – knowledge and understanding of economic concepts and mechanisms of the economy. Financial knowledge helps people to understand the financial concepts and procedures, as well as to use this understanding in solving financial problems. It is the knowledge of how to manage money in different usage, including the monitoring of day-to-day financial matters in the market and make the right choices for “financially literate” people’s needs. Parts of financial knowledge includes:
 - Conceptual financial knowledge,
 - Procedural financial knowledge,
 - Applied financial knowledge.
- b. Financial skills – application of acquired economic knowledge in economic decisions (analysis, evaluations, choices). It is the ability to use knowledge and understanding to manage an expected or unpredictable situation to solve a financial problem and convert it into a benefit and opportunity to one’s advantage.
- c. Financial attitudes – motivation and readiness to use knowledge and economic skills in various situations. They are the individual characteristics that take the form of tendencies towards a financial practice or action. They show the inclination or likelihood of a person to undertake a behavior.
- d. Financial behavior – behavior in specific situations on the financial market.

2.2 THE THEORY OF PLANNED BEHAVIOR

The Theory of Planned Behavior (TPB) has become one of the most utilized theories in terms of explaining and predicting behaviors of individuals. The TPB has been cited over 5000 times according to the Web of Science since Icek Ajzen originally published it in book (1988) and article (1991) form. The TPB’s main assertion’s are that behavior is preceded by one’s intentions to perform the behavior and perceived control over the behavior (Ajzen, 1991).

2.3 ATTITUDE

The TPB relies on an expectancy-value formulation to describe the formation of attitude toward a behavior. Specifically, attitude toward the behavior is assumed to be a function of readily accessible beliefs regarding the behavior's likely consequences, termed behavioral beliefs. A

behavioral belief is the person's subjective probability that performing a behavior of interest will lead to a certain outcome or provide a certain experience, for example, the belief that wearing a heart monitor (the behavior) can detect heart arrhythmia (the outcome) or is inconvenient (the experience) (Ajzen, 2020). Attitudes are defined as an individual's positive or negative evaluation of self-performance of the particular behavior.

2.4 SUBJECTIVE NORM

Subjective norms are the societal pressures placed on a person to act in a certain way (Ajzen, 1991). Members of collectivist cultures are more sensitive to subjective norms than members of individualistic cultures, and this pressure can come from anyone they know (Ajzen, 2002). Subjective norm or normative pressure is defined as an individual's behavior being influenced by actions proposed by close friends. "It can also be a person who approves or disapproves of an action," says the author (Ajzen & Fishbein, 1975).

2.5 PERCEIVED BEHAVIORAL CONTROL

Perceived behavior control is concerned with an individual's perception of their ability to engage in conduct (Ajzen, 1991). It also refers to available resources, such as purchasing power. Ajzen (1991) was the first to propose the concept of perceived behavior control. The greater the PBC over the intention, the more resources and opportunities people believe they have (Madden, Ellen, & Ajzen, 1992). PBC is an individual's assessment of their ability to undertake a specific activity, and it has become one of the most powerful predictors of intention (Notani, 1998). Perceived Behavioral control (PBC) refers to a person's perceptions or beliefs about having access to the knowledge, resources, and opportunities needed to engage in a particular action (Ajzen, 1985).

2.6 PURCHASE INTENTION

Purchase intention refers to the probability of consumers purchasing products or is defined as a measure of the strength of one's intention to perform a specific behavior or decide to buy a product or service. The higher the likelihood, the stronger the purchase intention (Schiffman & Kanuk, 2015). Understanding consumers' purchase intentions can help companies analyze the market and adjust their products or services to increase sales and generate more profits (Anastasiu & Dospinescu, 2019).

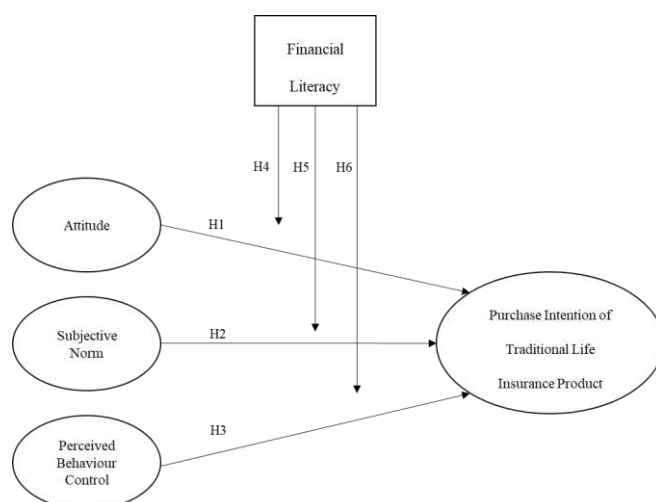

2.7 TRADITIONAL LIFE INSURANCE PRODUCT

The word traditional in terms of Traditional Life Insurance is due to modifications in life insurance products, especially those that have recently been rife, namely Unitlink Life Insurance, where the product is combined with mutual fund investment instruments.

Two major types of life insurance are currently called Traditional Life Insurance: Term Life Insurance and Whole Life Insurance.

3. RESEARCH FRAMEWORK

The research will focus on the factors that affect Consumer Purchase Intention of Traditional Life Insurance Product. This research is measuring the effect of consumer attitude (ATT), consumer subjective norm, consumer perceived behavioral control (PBC) toward purchase intention (PI) of Traditional Life Insurance Product and measuring the effect of financial literacy (FL) as moderating role towards the relationship between consumer attitude (ATT), consumer subjective norm, consumer perceived behavioral control (PBC) and purchase intention (PI). Theoretical framework and hypotheses will be as follow:

Research Framework
Source : Author (2023)

- H1 : The higher (lower) attitude (ATT), then the higher (lower) purchase intention (PI).
- H2 : The higher (lower) subjective norm (SN), then the higher (lower) purchase intention (PI).
- H3 : The higher (lower) perceived behavioral control (PBC), then the higher (lower) purchase intention (PI).
- H4 : The higher (lower) Financial Literacy (FL) will impact the dynamic between attitude (ATT) and purchase intention (PI).
- H5 : The higher (lower) Financial Literacy (FL) will impact the dynamic between subjective norm (SN) and purchase intention (PI).
- H6 : The higher (lower) Financial Literacy (FL) will impact the dynamic between perceived behavioral control (PBC) and purchase intention (PI).

4. METHODOLOGY

4.1 SAMPLE & DATA COLLECTION

In February 2023, the researcher collected primary and secondary data to strengthen the study. In the form of a survey, the primary data is a source of research data gathered directly from the source (without intermediaries). In this investigation, primary data will be collected directly through online surveys completed by 162 respondents. In contrast, secondary data is the source of research data obtained by looking for and gathering materials from literature reviews, research, books, and reports, as well as comments from Google, IPMI, or the academic supervisor, as outlined in Table below.

Type of Data	Description	Sources
Primary Data	Responses to questionnaires	Life Insurance Products Consumers', especially who already purchase unit-link product in Jabodetabek area with minimum education S1 and monthly income between IDR 5,000,000 – IDR 100,000,000
Secondary Data	Materials by searching and collecting	Previous research, books, reports, and feedbacks from Google, IPMI or the academic supervisor

In order to gather data efficiently and in a reasonable amount of time, questionnaires will be given via an online form to participants in this study. The questionnaire format consists of closed-ended questions in which the responder selects a response from a list of possibilities.

Google Forms was used to generate an online survey, which was then sent to targeted responders via WhatsApp. Moreover, the online survey distributed in February 2023.

Typically, research is conducted on samples rather than entire populations. A survey is valuable and effective for answering research questions through data collection and subsequent analyses. A population is the total number of individuals with particular characteristics, while a sample is a subset of the population. By studying the sample, the researcher can draw findings that apply to the target population. This study's population consists of individuals familiar with life insurance products. Either they are consumers/customers of life insurance products or are interested in or knowledgeable about such goods.

Sampling is the process of picking the appropriate person, object, or event for investigation. Types of sample design are probability and non-probability sampling. For probability sampling, there is a known likelihood that sample participants will be selected from the population. According to Shekaran, in non-probability sampling, elements have no known or predefined likelihood of being selected as subjects for sampling (2003). In this investigation, we shall employ the non-probability sampling technique called purposive sampling. The sampling is restricted to several categories of persons who are able to supply the needed information, either because they are the only ones have it or because they meet the researcher's predetermined criteria. Convenience sampling refers to the practice of selecting samples from a population based on ease of access. Another sampling method is snowball sampling, which uses a small number of cases to entice additional cases to participate in the study and increase the sample size.

This study will employ the techniques of purposive and snowball sampling to identify the sample, keeping the following considerations and criteria in mind:

- People who has at least one protection from any life insurance products (esp. unit-link Life Insurance Product), with a minimum 21 years old, S1 Education, and minimum monthly income between IDR 5,000,000 – IDR 100,000,000 in greater area Jabodetabek (representative of consumers/ customers)
- People who interested and understand life insurance products, either they work in insurance companies or in an insurance projects or assignments, in greater area Jabodetabek.

According to Hair et al. (2014), the sample size will impact the suitability and statistical power of multiple regression, as well as generalizability.

4.2 MEASUREMENT & SCALING

The variable research was utilized to support chapter 2 ideas. Some variables have already been updated and modified based on customer behavior and industry conditions observed when purchasing a local brand of perfume. The operational variables in this research are represented by 25 indicator items. On a four-point Likert scale ranging from strongly disagree (1) to strongly agree (4), the factors under study are measured. In the format of a questionnaire, the variables' explanation and measurement items are provided in the table below

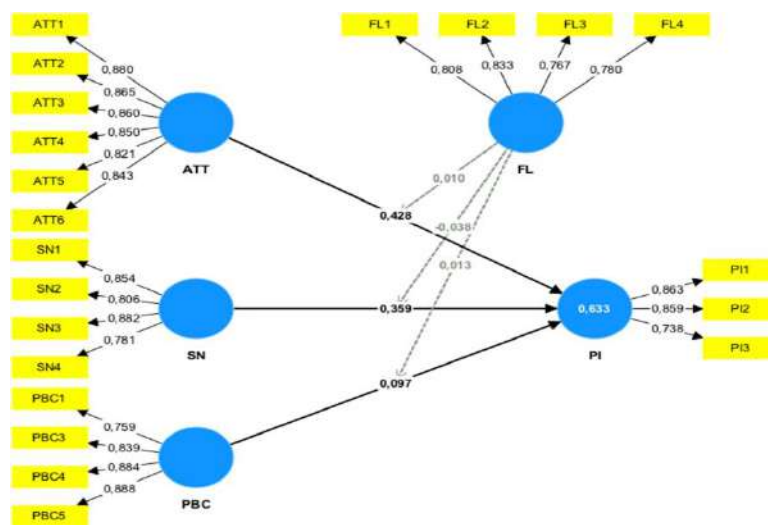

Variable	Measuring Item	Scale	Source
Attitude (ATT)	1. Buying traditional life insurance product is a good idea. 2. Buying traditional life insurance product is a wise choice. 3. I like the idea of buying traditional life insurance product	4-point likert scale	(Wang et al., 2013; Ariffin et al., 2019)

	<p>4. Buying traditional life insurance product would be pleasant.</p> <p>5. I like to choose traditional life insurance product</p> <p>6. Buying traditional life insurance product is my own choice.</p>		
Subjective Norm (SN)	<p>1. Many people around me think of purchasing traditional life insurance product</p> <p>2. I feel social pressure to purchase traditional life insurance product</p> <p>3. Most people who are important to me, think I should purchase traditional life insurance product</p> <p>4. The people who I listen to, could influence me to purchase traditional life insurance product</p>	4-point likert scale	(Mishra et al., 2020)
Perceived Behavioral Control (PBC)	<p>1. It is easy to buy traditional life insurance product.</p> <p>2. I cannot decide whether to buy traditional life insurance product or other life insurance product e.g. Unit-link Insurance.</p> <p>3. It is very likely, I will choose traditional life insurance product next time.</p> <p>4. Buying habits of purchasing traditional life insurance product will have a strong impact on decision making.</p> <p>5. Past purchase traditional life insurance product experience will have strong impact on decision making.</p>	4-point likert scale	(Chen & Deng, 2016)
Purchase Intention (PI)	<p>1. I will buy traditional life insurance product frequently.</p> <p>2. I will encourage my relatives and friends to buy traditional life insurance product.</p> <p>3. I will buy traditional life insurance product in the near future.</p> <p>4. It takes a long time for me to purchase traditional life insurance product.</p>	4-point likert scale	(Wang et al., 2013)
Financial Literacy (FL)	<p>1. Knowledge ; I have good knowledge or understanding related the financial concept especially about Traditional Life Insurance product to achieve my financial goals</p> <p>2. Skills ; I have ability to use my knowledge or understanding about the financial concept to choose the most suitable Traditional Life Insurance Product to support to achieve my financial goals</p> <p>3. Attitude ; I have positive views towards Traditional Life Insurance product if there's financial situations happen beyond my financial planning e.g. wrong financial</p>	4-point likert scale	(Beata, 2019)

	decision-making, unemployment and unexpected medical bills 4. Behaviour ; I know what to do with my Traditional Life Insurance’s policy in case there’s specific situations happen on the financial market e.g. economic recession or new policy about Traditional Life Insurance product from regulator or government.

5. FINDINGS, ANALYSIS & DISCUSSION

Outer Model

Source: PLS-SEM Report, 2023

5.1 RESULTS

5.1.1 Measurement Model Testing

The instrument's validity and reliability were evaluated on a small scale to ensure their quality and the respondents' comprehension of the items. First, Cronbach's alpha reliability coefficients were utilized to examine the internal consistency (reliability) (Zikmund et al., 2013). Cronbach's alpha value of 0.70 as a minimal point of reliability demonstrated that the questionnaires were reliable (Shekaran, 2010). Second, Pearson's Correlation is utilized to distinguish the validity of the questionnaires. Pearson (1948) stated that 0.3 is the legitimacy of the relationship between the factors to determine the quality of their successful run and that a confidence level of 0.05 is valid. The results of the instrument's validity and dependability are displayed in Table below

Indicator	Outer Loading	Cronbach's alpha	Composite reliability (rho_a)	Composite reliability (rho_c)	Average variance extracted (AVE)
ATT1	0.880	0.926	0.929	0.942	0.729
ATT2	0.865				

ATT3	0.860				
ATT4	0.850				
ATT5	0.821				
ATT6	0.843				
FL1	0.808				
FL2	0.833	0.812	0.822	0.875	0.636
FL3	0.767				
FL4	0.780				
PBC1	0.759				
PBC3	0.839	0.865	0.881	0.908	0.712
PBC4	0.884				
PBC5	0.888				
PI1	0.863				
PI2	0.859	0.760	0.781	0.861	0.676
PI3	0.738				
SN1	0.854				
SN2	0.806	0.852	0.875	0.900	0.692
SN3	0.882				
SN4	0.781				

Validity & Reliability Test Result

5.1.2 Structural Model Testing

The relationship between the latent variables is revealed by evaluating the structural model (or inner model). Path coefficient, collinearity issue (VIF), coefficient of determination R^2 , and effect size f^2 must be validated to evaluate the structural model.

The coefficient of determination - R Square (R^2) calculates the variance of the dependent variable concerning the change of the independent variable. The R^2 value ranges from 0 to 1, with a higher score indicating greater predictive accuracy. R^2 values for an endogenous variable of 0.25, 0.5, or 0.75 can be interpreted as weak, moderate, or substantial (Hair et al., 2011). Table below shows the results of the analysis.

Variable	R-square	R-square adjusted	Note
PI	0.633	0.610	Moderate

R-Square

Source: PLS-SEM Report, 2023

The R^2 of Purchase Intention (PI) in Table R-Square has a moderate level of predicting accuracy (0.608), which is a significant level and close to 1 as an indicator of excellent predicting accuracy to evaluate structurally.

Based on the findings in Table R-Square, the Purchase Intention score is 0.633. This means that Attitude, Subjective Norm, Perceived Behavioral Control, and Financial Literacy have a 63.3% influence on the Purchase Intention variable while the remaining 36.7% is influenced by other variables not studied in this research.

6. CONCLUSION & RECOMMENDATION

6.1 RESEARCH CONCLUSION

The bootstrapping method determines the significance of path coefficients by producing empirical t values that are significant if they are greater than the critical value (t distribution values) at a given probability of error. This study used the following critical values for two-tailed tests: 1.65 (significance level= 5%) (Hair et al., 2017).

The bootstrapping test was used to determine the importance of path coefficients (t distribution values) by calculating empirical t values greater than the critical value. The coefficient is considered significant at a given likelihood of error. 5000 bootstrap samples are recommended (Hair et al., 2017). SmartPLS 3.0's bootstrapping approach was used to test hypotheses and investigate the significance of path coefficients and t values. The two-tailed t-value is 1.65, and the p-value is 0.05 (at 5%). The findings are summarized in Table 4.13 were only two hypotheses were found to be supported, as shown below.

Hypothesis	Variable	Path Coefficient	T-Statistics	P Values	Result
Direct					
H1	ATT -> PI	0.428	3.512	0.000	H1 Supported
H2	PBC -> PI	0.097	0.648	0.517	H2 Not Supported
H3	SN -> PI	0.359	5.590	0.000	H3 Supported
Moderating - Financial Literacy (FL)					
H4	FL x ATT -> PI	0.010	0.078	0.938	H4 Not Supported
H5	FL x PBC -> PI	0.013	0.089	0.929	H5 Not Supported
H6	FL x SN -> PI	-0.038	0.642	0.521	H6 Not Supported

Hypothesis Testing Result

Source: PLS-SEM Report, 2023

Attitudes Influence Against Purchase Intentions. This is evidenced by the original sample value of 0.428, which means it has a positive relationship. The t-statistic value in this constructed relationship is 3.512 with a two-tailed value of 1.68 at a significance level of 5 percent where the criteria mean that the criteria for the t-statistic are > 1.68 and the p-value is 0.000 so that the attitude relationship affects Purchase Intention declared significant. Therefore, the first hypothesis states that Attitude influences Purchase Intention is accepted.

The original sample value of 0.097 indicates that Perceived Behavioral Control has no positive influence on Purchase Intention. The t-statistic value for this constructed relationship is 0.648, with a two-tailed value of 1.68 at a significance level of 5%, and the p-value is 0.517, indicating that Perceived Behavioral Control does not affect Purchase Intentions. As a result, the second hypothesis, which states that Perceived Behavioral Control has a significant effect on Purchase Intention, is rejected.

The original sample value of 0.359 indicates that the Subjective Norm influences Purchase Intention, indicating a negative relationship. The t-statistic value in this constructed relationship is 5.590, with a two-tailed value of 1.68 at a significance level of 5%, where the criteria mean that the t-statistic value criterion must be greater than 1.68 and the p-value is 0.000, indicating that the Subjective Norm affects Purchase Intention is significant. As a result, the third hypothesis, stating that Subjective Norms have a significant effect on Purchase Intention, is accepted.

The original sample value of 0.010 indicates that the Financial Literacy construct cannot mediate the effect of Attitude on Purchasing Intention. The t-statistic value for this constructed relationship is 0.078 with a two-tailed value of 1.68 at a 5% significance level where the criteria mean that the criterion value of t-statistics must be 1.68 and the p-value is 0.938, indicating that Financial Literacy cannot mediate the effect of Attitude on Purchasing Intention. As a result,

the fourth hypothesis, that Financial Literacy can mediate the Effect of Attitude on Purchasing Intention, is rejected.

The original sample value of 0.013 indicates that perceived behavioral control cannot mediate the Effect of Perceived Behavioral Control on Purchasing Intention. The t-statistic value on this construct relationship is 0.089 with a two-tailed value of 1.68 at a significance level of 5% where the criteria the t-statistic value must be 1.68 and the p-value is 0.929 indicating that Financial Literacy cannot mediate the Effect of Perceived Behavioral Control on Purchasing Intention. As a result, the fourth hypothesis, that Financial Literacy can moderate the Effect of Perceived Behavioral Control on Purchasing Intention, is rejected.

The original sample value of -0.038 indicates that Financial Literacy cannot mediate the Effect of Subjective Norm on Purchasing Intention. The t-statistic value on this construct relationship is 0.642 with a two-tailed value of 1.68 at a significance level of 5% where the criterion value of the t-statistic must be 1.68, and the p-value is 0.521 indicating that Financial Literacy cannot be mediate the Effect of Subjective Norm on Purchasing Intention. As a result, the fourth hypothesis, that Financial Literacy can mediate the Effect of Subjective Norm on Purchasing Intention, is rejected.

6.2 THE IMPLICATION OF THE STUDY

The findings of this investigation point to a possible conclusion. Because the measuring items obtained from linked products or different industries were not carefully modified prior to data collection. This could explain why the moderating effects of Financial Literacy (FL) on the impact of Attitude (ATT) on Purchase Intention (PI), Perceived Behavioral Control (PBC) on Purchase Intention (PI), and Subjective Norm (SN) on Purchase Intention (PI) did not always support. This was a result that described how the moderating effect of Financial Literacy (FL) has no positive or negative impact on the impact between the independent variable and Purchase Intention (PI).

To summarize, this study affirms that while Financial Literacy (FL) may not have a significant moderating effect, it certainly has an impact on Attitude (ATT) and Subjective Norm (SN), as independent variables that influence Purchase Intention (PI).

According to the research findings, only two variables can influence Purchase Intentions: Attitude and Subjective Norm. This results from research conducted on many respondents from the majority demographic, namely those between the ages of 31 and 40, with a bachelor's degree, working as private employees, and earning between 10 million IDR and 50 million IDR per month. As a result, insurance management can use this research to show how Attitude factors and Subjective Norm can influence purchase intentions in this respondent demographic, particularly when targeting consumers in that age range e.g., improving product feature and after-sales service.

ABSTRACT

Going concern and being sustainable in the market are the few purposes of the business. To be able to know whether a business is able to thrive in the market despite of any challenges, companies must always understand their financial performance. The company can get early indications and be ready of any financial distress and threats that might coming in the future. PT Sido Muncul Tbk will be analyzed using Altman Z-score model to understand their financial health. PT Sido Muncul Tbk (SIDO) is an herbal medicine manufacture company in Indonesia that has been listed in the Indonesia Stock Exchange (IDX). The analysis will cover the period 2018 – 2022 of the company financial statements. The result analysis of Altman Z-score model will give insights of the company's financial strength. The score above 3 in Altman Z-score means that the company is unlikely to go bankrupt, while the score below 1.8 indicates that the company is in the danger area to be bankrupt. Between 1.8 and 3 in Altman Z-score conveys that the financial health of the company is on the critical stage.

Keywords: Altman Z-Score, Financial Distress, Financial Health, Herbal Medicine Industry

Introduction

There are two ways of analyzing business performance which are a system of non-financial and financial indicators. This research will lean more using financial indicators to assess business performance. One of the indicators to evaluate business performance is using financial indicator (Kotane & Marlino, 2012). According to Bausman D. C. (2008), financial indicators measure profitability, cash flow, firm leverage and liquidity which are utilized to align organizational action, benchmark and reward performance. Moreover, financial data must give some learnings from past performance, define current conditions, and forecast the future performance of the firm (Bausman, 2003)

The appearance of Covid19, consumer behaviors tend to be more conscious in increasing their health as well as immune system. A new paradigm has been formed due this pandemic situation in people's behavior which they prioritize more in maintaining their health. According to Dwi (2021), many people start drinking herbal medicine in the ready-to-drink package of herbal medicine thus the numbers of sales have increased. This condition has created opportunities to companies that are running their business in consumer health industry. The demand for vitamins and health supplements shows a remarkable increasing trend. Therefore, it is very interesting to see consumer health company performance before, during, and post pandemic situation.

Therefore, PT Industri Jamu dan Farmasi Sido Muncul (SIDO) will be the subject of this research study to review on their business performance based on the financial indicators. A consumer health company is intently chosen for this study as the market is still growing. Based on Agency for Drug and Food Control (BPOM, 2021) on the first quarter of 2021 the consumer health industry had a growth of 11.46% compared to last year on the same quarter in domestic market. In Indonesia itself, consumer herbal market size is expected to grow at CAGR 5% in 10-years forecasted. Besides domestic market, this industry also contributed \$4.3bn on export market (BPOM, 2021). This also means that the market competition becomes fiercer since the number of product registrations increased significant by 131.14% versus last year.

Globally herbal medicine market size was valued at \$151.9bn in 2021 (Fortune, 2020) and the market is projected to grow at pace of CAGR 11% during the forecasted period. Looking within, Indonesia has around 30-thousands of herbal plants which have been used by herbal medicine industry. This herbal plant commodity is a great potential to be used as business opportunity, especially being healthy has become people lifestyle. Herbal medicine business has a good future and is attractive which has the potential to become a national economic strength by raising local wisdom of the nation.

This research paper will analyze the financial performance PT Sido Muncul as one of the largest herbals and pharmaceutical company in Indonesia. This study conducts PT Sido Muncul financial performance condition by using Altman Z-Score model. According to Altman (1998), Altman Z-Score model produces analysis on the possibilities of bankruptcy by utilizing financial ratios based on the financial statement.

Literature Review

1. Herbal Medicine Industry

Consumer Health industry for more than two years of global pandemic has changed consumer behavior which more aware about health and wellness (Kantar, 2022). One of product segments in consumer health is herbal medicine, which around 80% of population in the world consume herbal medicine (Ahmad Khan & Ahmad, 2019). Herbal medicine is widely known and defined by World Health Organization (WHO) as a medical product produced from a single or multiple of plant parts combined that contains active ingredients which packaged and labelled as a finished product (Ahmad Khan & Ahmad, 2019). In terms of herbal medicine, Indonesia ranked 4th as the world's main producer of medical plants.

2. Financial Statement

According to White, et.al 2002, general purpose of financial statement is to provide one basis for projecting future earnings and cash flows. Financial statement is important since it can enable investors and creditors to make a better economic decision. Anthony, Hawkins, and Merchant (2011) described financial statement as a set of report produced from the financial accounting process. Financial statement consists of Balance Sheet, Income Statement, and Cash Flow Statement. Annual financial statement needs to be provided on an annual basis to shareholders (Hayes, 2020) since this report will give a picture of the company's financial conditions. From the financial statement, investors and creditors can calculate financial ratios to understand better about the condition of the company financially. Reviewing firm performance using financial ratios has been traditional yet powerful way for decision-makers (Delen, et al., 2013).

3. Bankruptcy

In a normal condition, a business does not go bankrupt instantaneously, but it goes through a process of failure which varies considerably in length. Many researches show that a large corporate failure is characterized by a very lengthy failure process (Argenti, 1976; Hambrick & D'Aveni, 1988; Laitinen, 1991). The definition of business failure, based on Anjum Sanobar (2012), describes various unsatisfactory business conditions. Business failures include process of ceasing operation, loss to creditors, and leave unpaid obligations. According Ohlson (1980), financial ratios can be enforced to give an analysis of an early potential bankruptcy in a business. This insight is every essential to the stakeholders to take strategic business decisions.

4. Altman Z-Score Method

Edward Altman developed a model that has become a well-known predictor of bankruptcy. This predictor is a statistical model which incorporates five financial ratios to produce a product called a Z-Score. This model has been tested and proven to be a dependable instrument to forecast failure in many business entities in many industries.

$Z = 0.717X_1 + 0.847X_2 + 3.107X_3 + 0.42X_4 + 0.998X_5$
X_1 = Working Capital to Total Assets
X_2 = Retained Earnings to Total Assets
X_3 = Earnings Before Interest and Tax to Total Assets
X_4 = Market Value of Equity to Total Liabilities
X_5 = Sales to Total Assets
Z = Z-Score

Table 10 Altman Z-Score for Manufacturing Company

According to Altman, score above 2.9 on Z-Score indicates that the financial performance of the company is healthy. Score between 1.23 and 2.9 indicate that the company performance financially is in the critical stage. Moreover, score below 1.23 means that the company is potentially to be bankrupt.

There are financial ratios need to be calculated in order to identify the result of Z-Score. The result will give stakeholders some insights of the financial health of the company. This will be an important information coming from financial statement of the company for stakeholder taking strategic decision for the company going forward.

Methodology

1. Research Method

This research uses a quantitative approach that is carried out by analyzing the report data from financial statements which are employed into financial ratios to determine whether the company can be said healthy or unhealthy financially. Data are gathered from the annual report of PT Sido Muncul Tbk from the period 2018 – 2022. This research is conducted to review and forecast whether PT Sido Muncul is having financial distress.

2. Research Concept Framework

The research concept framework used in this study is based on the literature and the results of previous research. The purpose of this study is to examine the financial health condition of PT Sido Muncul Tbk using Altman Z-score model for bankruptcy indicator. Based on Figure 1 below, financial data is compiled from the annual report of the company period 2018 – 2022. Afterwards, the data will be applied to calculate the financial ratios that incorporate in Altman Z-Score model to get the results of the prediction of company bankruptcy. Once the results are available, it will be analyzed based on Altman Z-Score measurement and assessment. Finally, conclusion will be drawn based on the analysis.

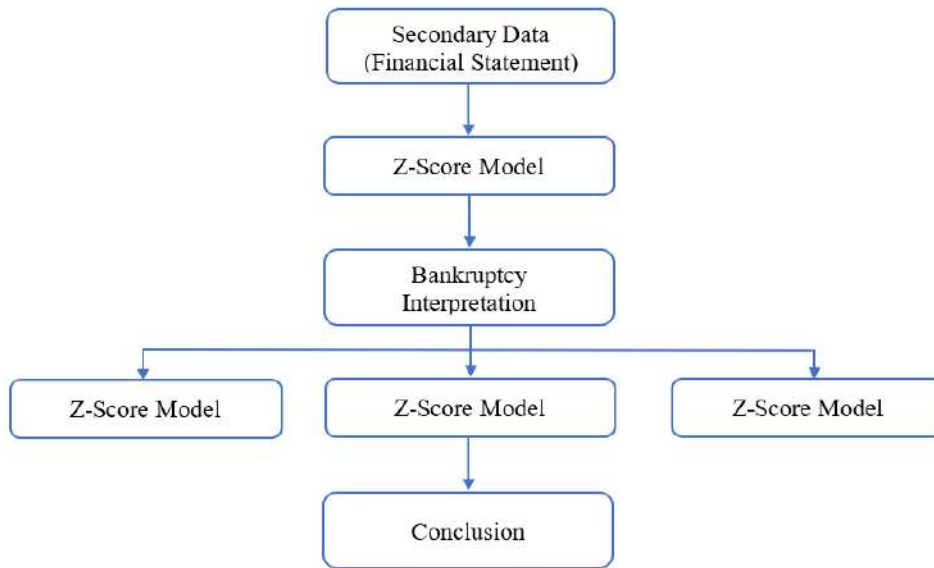

Figure 8. Research Concept Framework

Variable Operation Definition

1. Working Capital to Total Asset (X_1)

This ratio focuses on working capital capacity to total asset in order to measure net working capital liquidity (Gantino, et.al. 2018). This financial ratio is calculated by dividing net working capital to total asset, where working capital is often used by shareholders to measure the efficiency of operation in the company. According to Daryanto et.al (2020), negative net working capital indicates the company has some difficulties in covering the short-term liabilities because current assets are not sufficient to cover the obligations. Contrary, the positive net working capital shows that the company is able to pay off their short-term liabilities and able to have available funds to invest and grow.

$$X_1 = \frac{\text{Net Working Capital (Current Assets - Current Liabilities)}}{\text{Total Assets}}$$

2. Retained Earnings to Total Asset (X_2)

This ratio indicates the ability of the company to generate earnings from the company's total assets (Restianti, 2018). Retained earnings are determined as retention of profit after dividends are paid out (Viet, et.al, 2020). Retained earnings also indicates that company has available fund to do capital expenditure for pursuing business growth

$$X_2 = \frac{\text{Retained Earnings}}{\text{Total Assets}}$$

3. Earnings Before Interest and Tax to Total Assets

Earnings before Interest and Tax (EBIT) is an amount after deducting gross profit with marketing, distribution, and general expenses. EBIT tells us that the company can do interest

payment and tax obligation. This ratio demonstrates a company's ability to generate revenues to stay profitable and finance ongoing operations and make debt payments.

$$X_3 = \frac{\text{Earnings before Interest and Tax}}{\text{Total Assets}}$$

4. Market Value of Equity to Total Liabilities

This ratio shows the company's ability to meet their obligations from the market value of equity. Market Value of Equity is also known as market capitalization which measured by multiplying the current stock price by the number of shares outstanding. Total liabilities in here are combining the current liabilities and non-current liabilities.

$$X_4 = \frac{\text{Market Value of Equity}}{\text{Total Liabilities}}$$

5. Sales to Total Assets

Sales is the income a business can generate from a transaction of the sales of the goods or services. Usually, sales can be recognized when invoices are issued to the customers which recorded in the income statement. Moreover, Total assets are combining current assets and non-current assets. This ratio indicates the level of effectiveness of a company to generate sales by optimizing the assets.

$$X_5 = \frac{\text{Sales}}{\text{Total Assets}}$$

Results and Discussions

1. Working Capital to Total Assets

Below table shows the X_1 value of Altman Z-Score by calculating net working capital to total assets.

in million IDR	2018	2019	2020	2021	2022
Current Assets	1,547,666	1,716,235	2,052,081	2,244,707	2,194,242
Current Liabilities	368,380	416,211	560,043	543,370	541,048
Net Working Capital	1,179,286	1,300,024	1,492,038	1,701,337	1,653,194
Total Assets	3,337,628	3,536,898	3,849,516	4,068,970	4,081,442
X_1	0.35	0.37	0.39	0.42	0.41

Table 11 Net Working Capital to Total Assets (PT Sido Muncul Tbk)

Based on Figure 2 PT Sido Muncul could manage positive value from the calculation of net working capital to total assets. The company even could increase the ratio value since 2018 until 2022. Looking at the proportion of current liabilities, PT Sido Muncul maintained current liabilities at around ~24% to current assets, except for year 2020 the current liabilities proportion increased to 27% to current asset where Covid19 pandemic worsen in Indonesia. However, the ratio value of X_1 in year 2020 was improving compared to 2019 driven higher

cash and account receivable. These ratio values indicate that PT Sido Muncul had available spare funds to do investments.

2. Retained Earnings to Total Assets

Table below shows the result of calculating retained earnings to total assets of PT Sido Muncul Tbk.

in million IDR	2018	2019	2020	2021	2022
Retained Earnings	755,452	917,545	1,073,314	1,323,435	1,353,670
Total Assets	3,337,628	3,536,898	3,849,516	4,068,970	4,081,442
X₂	0.23	0.26	0.28	0.33	0.33

Table 12 Retained Earnings to Total Assets (PT Sido Muncul Tbk)

The ratio result on X₂ shows positive value which means that PT Sido Muncul can fund the operations using the earnings. This also aligns with the low current liabilities in the ratio X₁ in the Altman Z-Score. The table above is showing that PT Sido Muncul made improvement on the retained earning to total assets ratio in the period of 2018 – 2022. However, looking on year 2022 the retained earning was stagnant compared to 2021. This was driven by lower revenue compared to 2021, however, they managed to maintain the gross profit percentage level at 56%. Unfortunately, the expense of employee benefits was also increasing in year 2022 which deteriorating the net income. This expense was accrued in 2021 and released it in year 2022 which also reflected in the employee benefits liabilities lowering in the 2022 versus 2021.

3. Earnings Before Tax and Interest to Total Assets

Table below shows the result of calculating EBIT to total assets ratio of PT Sido Muncul Tbk

in million IDR	2018	2019	2020	2021	2022
Earnings before Interest and Tax	867,837	1,073,835	1,199,548	1,613,231	1,419,852
Total Assets	3,337,628	3,536,898	3,849,516	4,068,970	4,081,442
X₃	0.26	0.30	0.31	0.40	0.35

Table 13 EBIT to Total Assets (PT Sido Muncul Tbk)

Positive ratio of X₃ variable in Altman Z-Score showing that PT Sido Muncul could finance the operation expenses through the gross profit generated on every revenue made. Improvement on the ratio shown from year 2018 until 2021, however, in year 2022 it showed a decrease in EBIT amount. Looking deeper to the financial statement, it is driven by realizing employee benefits liabilities to income statement in year 2022. Therefore, the ratio in year 2022 is lower compared to 2021, but it is still improving compared to 2020.

4. Market Value of Equity to Total Liabilities

Table below is the result of calculating the market value of equity to total liabilities of PT Sido Muncul Tbk

in million IDR	2018	2019	2020	2021	2022
Market Value of Equity	12,211,693	18,402,822	23,809,322	25,921,875	22,123,846
Total Liabilities	435,014	472,191	627,776	597,785	575,967
X₄	28.07	38.97	37.93	43.36	38.41

Table 14 Market Value of Equity to Total Liabilities (PT Sido Muncul Tbk)

Since liabilities of PT Sido Muncul Tbk is quite small and looking at the table above the market value of equity is improving from time to time, it makes the ratio of X₄ in Altman Z-Score quite big. Looking at the total liabilities where the amounts are not far away from the current liabilities. It can be said that PT Sido Muncul Tbk are leaning more to capital equity to finance their assets. It also shows that PT Sido Muncul has a positive market sentiment, even though in year 2022 the market capitalization decreased versus 2021, the ratio still maintained the same with 2019 and higher compared to 2020.

5. Sales to Total Assets

Table below showing ratio of sales to total assets from PT Sido Muncul Tbk

in million IDR	2018	2019	2020	2021	2022
Sales	2,763,292	3,067,434	3,335,411	4,020,980	3,865,523
Total Assets	3,337,628	3,536,898	3,849,516	4,068,970	4,081,442
X₅	0.83	0.87	0.87	0.99	0.95

Table 15 Sales to Total Assets (PT Sido Muncul Tbk)

This table shows that PT Sido Muncul Tbk has been improving the effectiveness and efficiency of using the asset to produce revenue. It is shown by the ratio calculated in X₅ in Altman Z-Score table above resulting in positive value. Lower sales in 2022 was driven by normalization of sales in 2021 since Indonesia was hit by Omicron Covid19 and 2022 the pandemic situation was more under controlled by the government. Moreover, the tension between Ukraine and Russia that created global supply disruption and caused inflation. These affected people’s purchasing power and rising prices of imported raw materials had impacted the sales performance.

6. Result of Z-Score

Below is the result of Z-Score of PT Sido Muncul Tbk based on the ratios calculated coming from the financial statement in the period 2018 – 2022

Figure 9 PT Sido Muncul Altman Z-Score

The result of Altman Z-Score of PT Sido Muncul Tbk showing that the score is far above score 3. This means that PT Sido Muncul Tbk has a good financial performance and quite far from bankruptcy. The ratios are even improving from 2018 to 2021, except 2022 result was slightly lower compared to 2021 due external factors such as the rising tension between Ukraine and Russia, higher inflation rate, increase raw material components price. Nevertheless, according to the Altman Z-Score above, PT Sido Muncul is in the safe zone.

Conclusion

This research is to give analysis of PT Sido Muncul Tbk on the financial performance in the period 2018 – 2022. The analysis is to see any possibilities of going bankrupt by using Altman Z-Score model. Financial performance of PT Sido Muncul Tbk based on the ratio result of net working capital to total assets, retained earnings to total assets, earnings before interest and tax to total assets, market value of equity to total liabilities, and sales to total assets. The results value from mentioned ratios are showing positive value and even improving year by year from 2018 to 2021, with a slow growth in 2022 due to external factors.

From all ratios, year 2022 showing a decline versus 2021 which caused by supply disruption due to Ukraine and Russia tension and this also caused an increase in raw material prices. Besides that, inflation rate was also increasing which impact to people' purchasing power. This impacted heavily to middle lower income economic people which tend to prioritize meeting basic needs.

Overall the score of Altman Z-Score for PT Sido Muncul is far above 3 which means that the business is sustainable and in the safe zone from bankruptcy. The highest score is 21.01 in year 2021 where the company was very effective in generating revenue from the company's assets. Slightly lower in 2022 but still manage to have higher versus 2020. PT Sido Muncul can be considered as a sustainable business going forward since company will face lengthy failures before bankruptcy (Argenti, 1976; Hambrick & D'Aveni, 1988; Laitinen, 1991). The Z-score of PT Sido Muncul is almost 6 times higher than the minimum score of 3 in Altman Z-score model.

The findings of this research can be utilized by shareholders to support taking the decision in investing to the company. To improve the ratio of Altman Z-Score, the management can do focus on the marketing and promotional program to increase more sales and do saving initiative programs to improve earnings before interest and tax. The company also can leverage digital marketing and E-commerce in promoting and selling the products.

ABSTRACT

The purpose of this study is to analyze the financial performance of a coal mining company listed on the Indonesia Stock Exchange (IDX), PT. Indo Tambangraya Megah Tbk (ITMG) whether an entity is stable, solvent, liquid, or profitable enough to warrant a monetary investment. The benefit is also to evaluate economic trends, set financial policy, build long-term plans for business activity, and identify projects or companies for investment. Apply financial metrics analysis of ITMG's financial performance. Selected metrics include return on assets, debt-to-equity and debt-to-asset ratios, asset turnover, current ratios, profit margins, and return on equity. This study used quantitative research methods and targeted sampling techniques to collect the necessary data. The sample includes 5 years financial reports from 2018 to 2022. Then compare ITMG's financial performance analysis with ITMG's closest competitor, PT. Adaro Energy Indonesia Tbk, and the average indicator for the coal mining industry.

Based on the financial performance analysis, ITMG's financial performance in terms of profitability and liquidity has relatively significant financial performance compared to its competitors and the average industry. Despite positive trends in profitability and solvency, ITMG ranks asset utilization efficiency as quite concerning. It also shows that only profitability is affected by fundamental financial factors such as asset turnover and financial leverage.

Keywords: Financial Statements, Financial Ratios Analysis, Leverage, Liquidity, Turnover, Profitability.

INTRODUCTION

Recent Global and National Economic

In 2022, the global economy experienced a significant slowdown, surpassing the expected rate, primarily due to the crisis in the cost of living and tightening financial conditions in various regions. The persistence of the COVID-19 pandemic and the escalation of the Russia-Ukraine conflict further exacerbated the situation. Inflation reached its highest level in decades during this period. Although there was a rebound in 2021, global economic growth decreased from 6.0% in 2021 to 3.2% in 2022. The average of 2022 inflation rate was 8.8%, exceeding the average rate of the past decade.

Despite these challenges, Indonesia managed to maintain its recovery and strengthen its economy in 2022. The country's abundant resources allowed it to benefit from increasing commodity prices. Supported by improved investment and government spending, Indonesia's economy continued to grow at an accelerated pace. According to the Central Statistics Agency, the Indonesian economy expanded by 5.72% compared to the previous year, maintaining its positive growth trend.

The prolonged Russia-Ukraine conflict resulted in soaring commodity prices in 2022, leading to Indonesia achieving its highest export earnings in that year. Although exports began to slow down towards the end of 2022, the resilient domestic demand is expected to mitigate the impact on the economy.

Global and National Coal Industry Overview

The global coal market experienced significant disruptions in 2022, leading to soaring prices and a record-breaking demand of over 8 billion tonnes. The Russia-Ukraine conflict played a major role in altering coal trade dynamics and supply patterns during this period.

Various factors, such as higher coal prices, increased adoption of renewable energy and energy efficiency measures, and weakened global economic growth, limited the overall growth in coal demand. In China, which accounts for more than half of global coal consumption, strict COVID-19 lockdowns and extreme weather conditions impacted economic activity and coal demand. China faced both drought and heatwaves, which led to a surge in coal burning for electricity to meet the rising demand for air conditioning.

Indonesian coal prices reached their highest levels in 2022 due to supply disruptions caused by the Ukraine conflict and other supply and demand issues in the global energy industry. The average price for GAR 4,200 kcal/kg coal was USD 85.70 per ton in 2022, significantly higher than the previous year.

Factors Influencing the Business Performance

The volatility of coal prices can have significant implications for the financial and profitability performance of companies and regions involved in the coal industry. Fluctuating prices can directly impact revenue, profit margins, and the cost structure of coal companies. The

measurement through financial ratio analysis provides insights into the financial and profitability performance of companies, and it is very beneficial for the company in evaluating the impact of coal price volatility, as well as cost controlling.

In today's globalized world, business success and a company's competitive position are the two most important indicators of a company's success. The company's financial condition and performance should be measured and evaluated to maintain a competitive advantage. Operational efficiency is another key factor in a company's ability to maintain a competitive advantage. To gain a competitive advantage in the market, management should conduct business as effectively and efficiently as possible (Sari, 2019); positive growth opportunities that increase the economic value of the company should be sought. Therefore, understanding how numerous factors affect a company's economic value, as reflected in its stock price and profitability, is critical to both management decisions and investment opportunities.

Analyzing a company's financial metrics is critical to gaining a better understanding of a company's financial performance and its competitive advantage in the industry. Financial indicators commonly used to measure a company's financial performance are return on assets, debt-to-equity and debt-to-asset ratios, asset turnover, current ratio, profit margin, return on equity, market return, and return on stock.

To demonstrate the impact of the above factors on company performance, this study chooses a coal mining company in PT. Indo Tambangraya Megah Tbk (ITMG). A coal mining company was deliberately chosen for this study because it contributes significantly to Indonesia's economic growth; it also faces intense competition in both domestic and international markets. Coal is an important energy source and plays a vital role in power generation. As minerals and natural springs are valuable assets that support the development of the country (Kotijah, 2012), the mining industry has become one of the pillars of the country's economic development and claims to be the largest contributor to the country's government revenue (Ramadhan, 2012). 2019). Indonesia is one of the largest coal producers and exporters, relying on the commodity to power the country's economy. According to Hasan (10AD), Indonesia ranks fifth among

6th International CEO Communication, Economics, Organization & Social Sciences Congress

world coal producers with an estimated annual production of 386 million tonnes and coal reserves estimated at 5.5 billion tonnes.

Mining companies in Indonesia play a vital role in promoting Indonesia's commodity export activities and attracting foreign investors to invest in Indonesia (Economic Indicators BPS, 2020). The influx of foreign investors has contributed to the rapid growth of Indonesia's mining industry for decades. Indonesia's coal reserves total 37 billion tonnes and are estimated to last up to 62 years if mining activities continue, the Energy and Natural Resources Ministry (ESDM) said. The purpose of this study is to analyze the financial performance of one of the largest coal mining companies in Indonesia. Indo Tambangraya Megah Tbk (ITMG) had a last reported market capitalization of Rs 26.6 trillion (Yahoo Finance, 14 June 2023). Products produced by ITMG include medium to high thermal coal with a calorific value of 4,300 – 6,300 kcal/kg. ITMG recently reported coal production of 16.6 million tonnes in 2022 and sales of 18.9 million tonnes.

The publicly listed coal mining company does have several competitors in the mining industry, both in the domestic and international market. To analyze ITMG's relative financial performance, PT. Adaro Energy Indonesia Tbk (ADRO) was selected as ITMG's closest competitor, as ADRO's business structure is most similar to ITMG's and operates in the same industry. ITMG was formally incorporated in 1987 and has been listed on IDX since 2007 (2021 annual report). As an Indonesian energy company with an expanding business scope, ITMG integrates the extraction, processing, and logistics of energy commodities. The company produces various grades of thermal coal, which it then sells to a large and diverse customer base in the Asia-Pacific region.

Company in Brief

PT Indo Tambangraya Megah Tbk. (ITM) is an Indonesian energy company that was established in 1987. It operates in various aspects of the coal industry, including mining, processing, logistics, and sales. ITM is committed to enhancing productivity and cost efficiency while maximizing the value of the coal value chain. It also engages in supporting activities such as coal terminal operations, port loading facilities, power plant operations, and working with mining contractors.

To adapt to the global shift towards renewable energy sources, ITM is diversifying its business and strengthening its core. One of its initiatives is the development of a Solar Hybrid Plant, which marks the beginning of its future energy ventures. ITM aims to improve the quality and affordability of its products and services by leveraging digital technology, prioritizing employee well-being and inclusivity, and engaging with the surrounding community. The company recognizes the importance of transforming work culture, mindset, and behaviors to thrive in the digital era.

ITM's vision is to be a leading Indonesian energy company that emphasizes technology, innovation, inclusion, and sustainability. It aspires to uphold Environmental, Social, and Governance principles while consistently striving for operational excellence.

1. LITERATUR REVIEW

Important measures of a company's success in achieving profitability and financial sustainability are sourced from the company financial statements (Demmer, 2015). Financial ratios computed from these financial statements are, in fact, powerful decision-making tools. Ratio analysis helps to quantify the risk and growth factors of a firm, supporting investors in making strategic investment decisions as it provides a more comprehensive measure of performance (Arkan, 2016). Companies listed on stock exchanges publish annual financial reports, allowing investors to gain a better understanding of the firm's business performance by performing a thorough financial analysis. Narayan and Reddy (2016) stated that studying the relationship between financial ratios and stock performance has been a prevalent subject for numerous studies in the finance field until today.

To evaluate the success of a company in enhancing firm value, analysts often use financial performance measures as the main indicators (Katja, 2009). According to Benjalux (2006) performance measures are the fundamentals in determining a company's economic worth which is useful for investment decision-making.

This study focuses on the coal mining sector in Indonesia by analyzing ITMG, a publicly listed coal mining company in Indonesia. This study examines what has been shown in previous studies on financial performance and stock returns, but which apply to different industries. Five key financial metrics that affect a company's value or stock price are typically measured: profitability, efficiency, liquidity, and solvency. Research conducted by Asmirantho & Somantri (2017) examines the effect of liquidity, solvency, profitability and market ratios on the stock price of a coal company listed on the Indonesia Stock Exchange during the period 2012-2016. The study incorporates Current Ratio (CR), Debt-to-Equity Ratio (DER), Total Assets Turnover (TATO), Return on Equity (ROE), and Earnings per Share (EPS).

Financial statements

The definition of financial statements in Financial Accounting Standards, according to the Institute of Indonesia Chartered Accountants/IAI (2015), is a structured presentation of an entity's financial position and financial performance. A balance sheet, income statement, and cash flow statement are all common components of financial statements. The report used in this study is the financial statement from the company's annual report for 2018–2022.

Ratio Analysis

Ratio analysis in this study aims to analyze ITMG financial performance relative to ADRO (ITMG's closest competitor) and the coal mining industry in Indonesia. The financial ratios included in the analysis are Return on Assets, Return on Equity, Gross Profit Margin, Current ratios, Debt Equity Ratio, Debt to Asset Ratio, and Asset Turnover.

Return on Equity (ROE), Return on Asset (ROA), and Gross Profit Margin (GPM) are profitability ratios most frequently used to analyze a company's financial performance and as

well as to predict stock prices or stock returns. According to Ristyawan (2019), the company's ability to generate profits for shareholders can be analyzed by interpreting its ROE. The higher the ROE, the more efficient a company is in utilizing the shareholders' capital to generate profits. ROA is also a useful profitability measure that assesses the ability of a company in utilizing assets to generate profits. GPM indicates how much profit a company makes after paying off its COGS. It measures the efficiency of a company using its raw material and labour during the production process.

Liquidity ratios are used to measure the company's ability to pay off short-term obligations at maturity and its operational activities (Hermanto & Agung, 2015). Chritianto & Firnanti (2019) state that a high Quick Ratio indicates that the company is highly capable in financing its short-term obligations and more able to distribute dividends to investors, increasing the investors' confidence in their capital invested in the company. An efficiency measure commonly used by analysts is asset turnover, which measures a company's efficiency in utilizing their assets base for revenue generation.

Financial ratios generally used to indicate a company's solvency and the degree of leverage are debt-to-asset ratio (DAR) and debt-to-equity ratio (DER). The higher the proportion of debt relative to asset, the greater the financial risk borne by the company. A higher financial risk will result in investors demanding a higher return, which would increase the company's overall cost of capital. As for a company's proportion of debt to equity, it indicates the extent to which the company can fulfill its obligations with capital as collateral (Kurniawan, 2021).

DuPont Analysis

The DuPont analysis, developed by DuPont in the 1920s, provides a framework for evaluating a company's fundamental performance. This analytical technique proves valuable in breaking down return on equity (ROE) to gain a deeper understanding of the primary drivers of a company's profitability. As elucidated by Blumenthal (1998), the DuPont model aids in visualizing financial information and serves as a helpful tool for comprehending the impact of operating, financing, and investment decisions on a firm's financial performance (Melwin et al., 2014; Voorhis, 1981).

The DuPont framework focuses on three key financial components that influence return on equity (ROE): operational efficiency, asset utilization efficiency, and financial leverage. Operational efficiency is evaluated by dividing the net profit margin or net income by total sales or revenue. Asset utilization efficiency is measured through asset turnover. Leverage is assessed by utilizing equity multiples, which involve dividing average assets by average equity, or can also be estimated using the debt-to-equity ratio.

2. METHODOLOGY

Data Collection

This study employed a quantitative approach followed by secondary data collection techniques. Coal mining companies listed in IDX is selected as the population data. The sample data uses ITMG, a publicly listed coal mining company in Indonesia. First, this research will analyze

ITMG financial performance by comparing ITMG financial performance position with its closest competitor by applying ratio analysis. This study uses financial ratio to measure the company's financial performance. Financial ratio became a basic tool, indicator, and norm to measure company performance (Barnes,1987).

Sample Size

The sample examined consists of 5-year financial reports of ITMG (from 2018 to 2022). These annual financial reports will then be compared against ADRO, which is also listed in IDX, as one of its closest competitors in the coal mining sector.

Variables of Study

Table 1 – List of Variables Study:

$\text{Return on Assets} = \frac{\text{Net Income}}{\text{Average Total Assets}}$	Profitability indicator relative to its total assets
$\text{Return on Equity} = \frac{\text{Net Income}}{\text{Shareholders' Equity}}$	A measure of management effectiveness in utilising company's assets to generate profits
$\text{Gross Profit Margin} = \frac{\text{Gross Margin}}{\text{Net Sales Revenue}}$	An indication of how much profit a company makes after paying off its COGS, to measure the efficiency of using raw material and labor during the production process
$\text{Current Ratio} = \frac{\text{Current Assets}}{\text{Current Liabilities}}$	An indication of a company's ability to pay short-term obligations or those due within one year
$\text{Debt to Equity Ratio (\%)} = \frac{\text{Total Debt}}{\text{Shareholders' Equity}} \times 100\%$	Measurement to indicate the relative proportion of debt to shareholders equity utilised to finance the assets of the company
$\text{Debt to Assets Ratio (\%)} = \frac{\text{Total Debt}}{\text{Total Assets}} \times 100\%$	Measurement of company's financial leverage
$\text{Total Asset Turnover} = \frac{\text{Net Sales}}{\text{Average Total Assets}}$	Indicator of total asset efficiency in generating revenues; representing cost advantage and competitive advantage in utilizing assets

3. FINDINGS AND DISCUSSION

ITMG Financial Performance Analysis

Coal prices reached their highest level in September 2022, at USD 457.8/ton. This was largely due to greater demand for fuel and electricity as countries slowly exited more stringent Covid-19 restrictions as well as fallout from the Russia-Ukraine war.

Despite the price of coal strengthening in 2022, ITM continued to maintain prudential cost management practices and strive to produce even more innovations to ensure business sustainability and resilience regardless of the uncertainties of the future.

Table 2 – ITMG Income Trend from 2018 – 2022

ITMG	2018	2019	2020	2021	2022
Revenue Growth	19%	-15%	-31%	75%	75%
Net Income Growth	2%	-51%	-70%	1157%	152%
EBIT Growth	11%	-58%	-42%	661%	113%
Net Profit Margin	13%	7%	3%	23%	33%

ADRO	2018	2019	2020	2021	2022
Revenue Growth	11%	-5%	-27%	58%	103%
Net Income Growth	-11%	-9%	-63%	547%	175%
EBIT Growth	-6%	-31%	-54%	436%	182%
Net Profit Margin	13%	13%	6%	26%	35%

ITM’s Net Revenue in 2022 was derived mainly from coal sales, as well as services provided to third parties, including heavy equipment rental to third parties from its mining contractor business. Net Revenue in 2022 booked an increase of 75%, from USD 2.1 billion in 2021 to USD 3.7 billion. This growth was due to an increase in coal sales of USD 1.5 billion, 76% throughout 2022.

In 2022, ITM booked an Operating Profit of USD 1.19 billion, soaring by 152% from USD 475.3 million in 2021. The increased coal prices was the main contributor to this growth.

ITMG has recovered significantly in 2021 compared to previous years, experienced exponential positive growth in net income by 1,157%, and improved by 152% in 2022 as shown in table 2. The impact of drastic changes as a result of a global pandemic is optimistic for ITMG, which is evident in the drastic income growth in the last financial year. The significant variations in ITMG’s income is most likely due to the fluctuations in the commodity market for the past 5 year. The spike in commodity price during the pandemic also substantially contributed to the exponential revenue growth that ITMG experienced in 2021 and 2022.

Table 3 – Summary of ITMG and ADRO average financial ratios

Table 3 illustrates the key financial ratios that indicate ITMG relative financial performance and position over the 5-year-period from 2018 to 2022. From 2020 to 2021, the company ROE and ROA grew significantly. In comparison to the closest competitor (ADRO), ITMG still outperformed its competitor. In the past 5 years, ITMG has maintained positive ROA and ROE, indicating that the management has efficiently managed the company asset base and investor’s capital to generate returns for the capital providers. In particular, ITMG successfully achieved a 61.5% of ROE, outperforming ADRO in 2022. In terms of financial leverage, ITMG maintained a consistent proportion of debt financing as indicated by the stable debt-to-equity ratio over the past 5 years, at 2.13 on average. A relatively low proportion of debt implies that ITMG is financed more on equity, so that the company is less financially risky compared to the overall mining industry and its competitor. Furthermore, ITMG’s current ratios have been

Financial Ratios		2018	2019	2020	2021	2022	5-Year Avg.
Return on Assets (ROA) – %	ITMG	17.9	10.5	3.3	28.5	45.4	21.1
	ADRO	6.8	6.0	2.5	13.6	26.3	11.0
Return on Equity (ROE) – %	ITMG	26.7	14.3	4.5	39.6	61.5	29.3
	ADRO	11.0	10.9	4.0	23.1	43.4	18.5
Gross Profit Margin (GPM) – %	ITMG	29.1	19.0	16.8	44.1	52.1	32.2
	ADRO	33.4	27.9	22.7	44.3	57.4	37.1
Current Ratio (CR) – %	ITMG	1.97	2.03	1.98	2.71	3.26	2.39
	ADRO	1.96	1.71	1.51	2.08	2.20	1.89
Debt to Equity (DER) – %	ITMG	-	1.20	5.13	2.97	1.33	2.13
	ADRO	29.17	26.55	15.95	17.26	12.42	20.27
Debt to Assets (DAR) – %	ITMG	33.00	27.00	27.00	28.00	26.00	28.20
	ADRO	20.27	27.12	23.39	21.06	14.59	21.29
Total Assets Turnover (TATO) – times	ITMG	1.39	1.42	1.02	1.25	1.38	1.29
	ADRO	0.51	0.48	0.40	0.53	0.75	0.53

consistent at 2 on average for the past 5 years which shows that the company has no issues in servicing short-term obligations. As well as the ITMG’s asset turnover ratio (TATO) is outperformed compared to its competitor. Meanwhile, the GPM is relatively at the same level.

DuPont Analysis of ITMG Financial Performance

Return on equity (ROE) assesses whether the company can provide returns for shareholders (Asmirantho & Somantri, 2017). As highlighted by Chritianto & Firnanti (2019), ROE examines the extent to which a company uses its resources to provide profits. The higher the ROE value of a company indicates that the company uses its resources (equity) well to generate maximum return. Return on equity of ITMG experienced remarkable growth over the last 5 financial years from 26.7% to 61.5%. In particular, ITMG’s ROE improved substantially in 2021 by 35.0% from 2020 and by 21.9% in 2022 from 2021. This surge in ROE may be supported by the improvement of both asset turnover ratios and net income in the most recent

financial year. Deconstructing ITMG’s ROE further by applying the DuPont Framework Analysis into three main aspects:

1. Operating efficiency – Operating efficiency is represented by the profit margin ratio (net income divided by total revenues). As shown in Table 2, ITMG profit margin grew significantly from 2020 to 2021 (from 3% in 2020 to 23% in 2021), as well as from 2021 to 2022 (from 23% in 2021 to 33% in 2022). The increase can be explained by the increasing trend of overall revenues owing to the bullish commodity market in the last financial year.
2. Financial Leverage – The debt-to-equity ratio is an indicator of the financial leverage of a business. The higher the ratios of debt-to-equity, the greater the financial leverage and the risk of bankruptcy. The average debt-to-equity ratios for the past 5 years for ITMG is 2.13, and the most recent financial year at 1.33, lower compared to the prior year. From table 2, it can be seen that ITMG is financed less on debt, as shown by the overall decreasing trend in debt-to-equity and debt-to asset ratios.
3. Asset use efficiency – Asset use efficiency is measured by the asset turnover ratio (i.e., TATO). The ratio is relatively high compared to ADRO, ITMG improved its production reflected to its revenue from 2020 to 2021 and keep consistent in 2022 which may contribute to the growth in 2021-2022 ROE, even the other supply chain challenges due to unfavorable weather, labor and equipment supply constraint, outbreak of COVID-19.

The remarkable improvement in ROE is largely affected by a market factor– a surge in commodity prices in the market (Figure 2) – which increases ITMG’s total revenues and profit and the higher contribution of production. The DuPont framework pinpoints the main drivers of ITMG’s ROE, particularly in 2021. The analysis reveals that the exponential growth in 2021’s ROE is least likely to be affected by highly efficient asset utilization nor increase in financial leverage. The bullish commodity market, increase in commodity price, contribute largely to the improvement in ITMG’s profit, and in turn, increases its ROE ratio.

Figure 2 – Coal price trend for the last 5 years

Source: <https://tradingeconomics.com/commodity/coal>

CONCLUSIONS AND RECOMMENDATIONS

Conclusions

After conducting a comparative analysis of ITMG's financial performance, this study concludes that the company has demonstrated commendable financial performance, particularly in terms of generating positive returns and maintaining a moderate level of liquidity. This is evident from the increasing profitability ratios and the stable proportion of debts over the past five fiscal years. By employing DuPont ratio analysis, the researcher was able to ascertain whether the three fundamental factors, namely operating efficiency, asset-use efficiency, and financial leverage, are the true drivers behind ITMG's positive returns. The analysis reveals that the surge in commodity prices due to a macroeconomic shock, specifically the COVID-19 pandemic, is the primary reason for ITMG's enhanced profitability. Additionally, an increase in production compared to the previous year also contributed to this improvement.

Recommendations

When analyzing the financial performance of coal mining companies, it is important for investors to take into account external factors that can influence their operations. These factors include trends in supply and demand within the industrial sector, macroeconomic conditions, the political climate, and the volatility of commodity prices. Lev and Gu (2016) discovered that the usefulness of financial information declined significantly from 2003 to 2013, as more companies began relying on non-GAAP earnings information. Therefore, investors should be diligent in gathering the appropriate information, both financial and non-financial, from both internal and external sources, to make well-informed investment decisions.

To ensure the profitability of ITMG and maintain its financial health, it is crucial to consistently focus on optimizing asset utilization and efficiency, as well as carefully managing financial leverage. The findings also indicate the importance of continuous efforts to enhance asset effectiveness and cost efficiency in order to sustain profitability. Additionally, the company's ability to effectively control financial risks remains a top priority for maintaining sustainable profitability metrics.

Theoretical Implications

The study offers valuable insights into the current comprehension of analyzing financial performance and assessing the competitive position of companies within the market. The discoveries of this study present crucial lessons regarding the primary drivers of equity returns and profitability within Indonesia's coal mining industry. Previous research has demonstrated that factors like liquidity, leverage, asset efficiency, and profitability can influence stock returns either positively or negatively. However, this study revealed that none of these factors significantly affected the returns of coal mining companies' shareholders. It is recognized that external elements such as macroeconomic shocks will eventually alter the supply and demand trends in the market, exerting a greater influence on fluctuations in stock prices than the financial fundamentals of the company.

Other studies have shown that these and similar factors (leverage and asset turnover) can affect a company's profitability. The findings of this study are consistent with previous research on the impact of corporate fundamentals on profitability in various industry sectors.

Practical Implications

The study's findings offer valuable insights for market stakeholders and investors, guiding their decision-making and financial performance assessment in the Indonesian coal mining industry. In an unpredictable industry like extractive operations, it is crucial to adopt an approach that combines internal and market perspectives when evaluating a company's financial performance. Understanding both macroeconomic and fundamental factors plays a significant role in strategically analyzing the financial performance of resource companies. Furthermore, gaining a deeper comprehension of market and company fundamentals facilitates the development of more advanced economic models for predicting the financial performance of relevant companies. This model refinement proves beneficial for two main purposes: (1) aiding stakeholders in making investment decisions; and (2) directing management's focus towards key aspects that contribute to the company's value creation. It is important to consider external factors such as the political climate, economic fluctuations, and trends in interest rates and inflation when making investment decisions, in addition to assessing financial performance. Regarding the financial performance analysis of ITMG, it is recommended that the company innovates in the efficient utilization of resources for coal production, as it is a primary income source, in order to enhance ITMG's economic value. Assuming successful improvements in coal production and asset utilization efficiencies, alongside a stable capital structure, ITMG can expect increased profitability and positive returns in a favorable commodity market.

Limitations

There exist additional undisclosed factors that can greatly influence the profitability of coal mining companies and the stock prices in the market. These factors include fluctuations in coal prices, macroeconomic conditions, and weather-related elements, particularly rainfall, which holds notable importance in the coal mining industry.

Future research may further examine how these external factors affect a company's profitability since most companies operate in a volatile and dynamic market environment.

Leading Through Disruption: School Leaders' Role in Crisis Management and Recovering the XYZ School in the Post-COVID-19 Era

Amalia Seruni Permata INTAN

Sekolah Tinggi Manajemen IPMI, Jakarta 12750, Indonesia

amalia.intan@ipmi.ac.id

Orcid: 0009-0008-7782-379X

ABSTRACT

This conceptual paper examines the role of school leadership in crisis management and the recovery of the XYZ School in the post-COVID-19 era. It explores the specific challenges faced by school leaders at the XYZ Intercultural School and their strategies for effectively managing crises and rebuilding the institution. By addressing the limited research in this particular area, this study fills a gap by providing insights into the unique context of the XYZ School.

Through a synthesis of existing literature, qualitative research findings, and empirical evidence, this paper presents a comprehensive understanding of the pivotal role of school leadership in crisis management and school recovery. The proposed research framework highlights critical dimensions of school leadership, including strategic decision-making, communication, stakeholder engagement, and fostering resilience, and their impact on the XYZ School's recovery.

While this conceptual paper offers valuable insights and a research framework, further empirical studies are necessary to validate and expand upon the proposed propositions. Future research should examine the effectiveness of specific leadership practices in crisis management in the long run.

This study underscores the significance of school leadership in navigating crises, rebuilding the XYZ School, and fostering resilience in the post-COVID-19 era. It guides policymakers, educators, and the rest of the XYZ school communities to enhance leadership practices, facilitating the school's recovery and future success.

Keywords: Disruption, Education, Crisis Management, Transformational Leadership

INTRODUCTION

The COVID-19 pandemic caused significant disruptions to children's education, with school closures lasting approximately eighteen months. As the world transitioned into the post-pandemic era in 2021-2022, many schools in Jakarta still need to be more open to resuming in-person learning (Statistik Sektor Provinsi DKI Jakarta, 2022), despite encouragement from the Indonesian Ministry of Education and UNICEF (UNICEF, 2021). However, XYZ School emerged as a pioneering intercultural school in Jakarta, being among the first to open its doors and safely bring children back to the classroom.

During the pandemic, XYZ School also underwent a rigorous accreditation process from the International Baccalaureate Organization (IBO), demonstrating its commitment to maintaining high educational standards. Remarkably, despite the challenges posed by the pandemic, the school experienced a notable increase in student enrollment, becoming a sought-after choice for families seeking quality intercultural education in Jakarta.

In light of XYZ School's successful efforts in reopening and navigating the challenges of the pandemic, it is crucial to examine the factors that contributed to its ability to resume operations and attract a growing number of students swiftly. This extended abstract explores the leadership practices and decision-making processes employed by the Head of School, High School Coordinator, and Head of Business Office at XYZ School in the post-pandemic era.

By investigating the roles and leadership practices of these key school leaders, this research sheds light on the strategies and approaches that facilitated XYZ School's successful reopening and growth during a challenging period. Furthermore, it aims to understand the impact of their leadership practices on crisis management, student outcomes, financial perspective, and the overall recovery of XYZ School.

The findings from this study will provide valuable insights for educational leaders, policymakers, and practitioners seeking to navigate the complexities of reopening schools and ensuring a safe and effective learning environment in the post-pandemic era. It will also contribute to the existing knowledge base on effective leadership practices in times of crisis and inform future decision-making in the field of education.

In light of this, the following question arises: What were the leadership practices and decision-making strategies employed by the Head of School, High School Coordinator, and Head of Business Office enabled XYZ School to reopen and grow during the post-pandemic era successfully?

COMPANY BACKGROUND

XYZ School is a prestigious educational institution providing exceptional education since its establishment in January 1990. Fully authorized by the Indonesian Ministry of Education, XYZ School caters to both expatriates and Indonesian citizens, offering a comprehensive educational program from Pre-Kindergarten through Grade 12.

As an independent and co-educational day school, XYZ School is dedicated to maintaining the highest academic excellence and holistic development standards. The school's commitment to quality education is evidenced by its membership in the East Asia Regional Council of Schools

(EARCOS). This esteemed organization promotes excellence in education throughout the region.

XYZ School has also received accreditation from the Accrediting Commission for Schools of the Western Association of Schools and Colleges (WASC), further demonstrating its adherence to rigorous educational standards. This accreditation affirms the school's commitment to continuous improvement and ensures that it meets or exceeds the criteria for quality education. In recognition of its dedication to academic rigor and global education, XYZ School attained a remarkable achievement in 2020 by becoming an accredited International Baccalaureate (IB) Continuum School. Accreditation was granted for its exceptional implementation of the Primary Years Programme, Middle Years Programme, and Diploma Programme. These changes aim to prepare students to become lifelong learners, critical thinkers, and responsible global citizens, ensuring their readiness for future challenges and opportunities.

RESEARCH QUESTIONS, FRAMEWORK, AND HYPOTHESES

1.1 Research Questions

This study aims to address the following research questions:

Q1. How effective is the role and leadership practice of the Head of School in recovering the XYZ School during the post-pandemic era?

Q2. What is the effect of the Diploma Programme Coordinator's role on student outcomes during the post-pandemic era?

Q3. How effective is the Head of Business Office's leadership practices in increasing the financial stability and enrollment success of XYZ School after the pandemic era?

1.2 The Research Framework

Numerous studies support the significant relationship between a leader's role and their chosen leadership practices. Therefore, there will be three hypotheses formulated using the framework below:

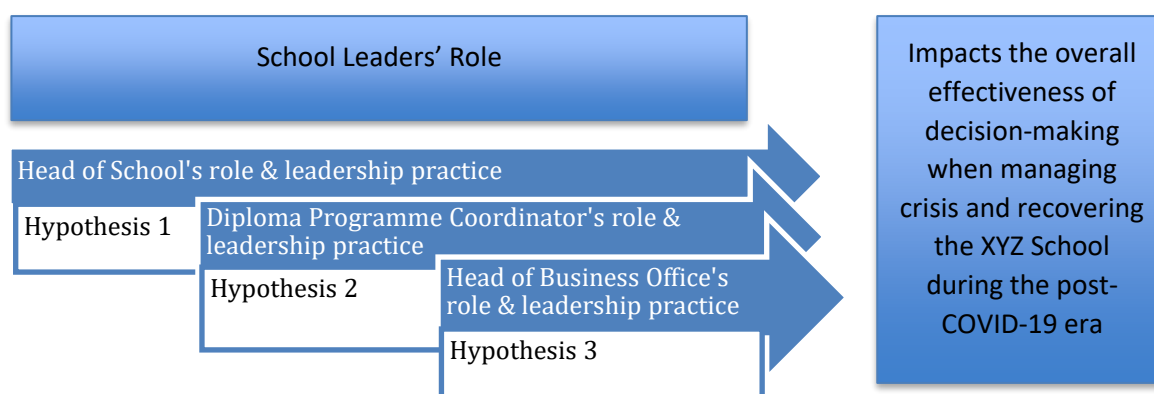

Figure 1.2: Hypotheses Framework

1.3 Hypotheses

Based on the research questions and the framework above, below are the hypotheses for this study:

H1. The role of the Head of School positively influences bite-sized decision-making needed to recover the XYZ School and get the community back on board.

H2. The role of the Diploma Programme Coordinator significantly impacts the student outcomes and the overall effectiveness of the high school at XYZ School.

H3. Head of Business Office contributes to effective financial planning and resource management at XYZ School.

These hypotheses propose that the specific leadership practices exhibited by the Head of School, Diploma Coordinator, and Head of Business Office directly impact their respective areas of responsibility at XYZ School. The hypotheses suggest that the presence of Adaptive Leadership practices by the Head of School will influence curriculum-changing decision-making, Transformational Leadership practices by the Diploma Coordinator will impact high school operations and student outcomes, and Distributed Leadership practices by the Head of Business Office will contribute to effective financial planning and resource management. By testing these hypotheses, the study examines the relationship between leadership practices and their outcomes within the context of XYZ School.

2. RESEARCH METHODOLOGY

2.1 Research Design

This study will employ a qualitative research design to gain an in-depth understanding of the roles and leadership practices of the Head of School, High School Coordinator, and Head of Business Office at XYZ School in the post-pandemic era. Qualitative methods will allow for a comprehensive exploration of their experiences, perspectives, and behaviors.

2.2 Data Collection

For the primary data, semi-structured interviews will be conducted with the Head of School, Diploma Programme Coordinator, and Head of the Business Office. These interviews will provide an opportunity to delve into their roles, leadership practices, decision-making processes, and experiences during the post-pandemic era. The interviews will be audio-recorded with the participant's consent.

This study will also collect secondary data from the student enrollment data, learning progress report, and accreditation success report from the International Baccalaureate Organization. The school's name will remain confidential, and the school name on the document will be edited as the XYZ school.

CONCLUSION

If the hypotheses are proven correct, the findings from this research will lead to the following conclusions:

6th International CEO Communication, Economics, Organization & Social Sciences Congress

1. Adaptive Leadership practices were implemented by the Head of School to positively influence crisis management and recovery efforts at XYZ School through flexibility, and adapting to multiple changes during the post-pandemic, to promote successful recovery of the school.
2. The Diploma Programme Coordinator implemented transformational leadership practice, positively impacting crisis management and recovery at XYZ School by motivating, supporting emotions, and guiding the school community toward curriculum changes and positive outcomes.

The Head of the Business Office utilized the Distributed leadership practice to contribute positively to crisis management and recovery at XYZ School through effective financial planning and resource management to maintain student enrollment and engagement.

ABSTRACT

For the last three years, almost every country on the earth has been affected by the COVID-19 pandemic, which is incredibly contagious. As a result, several countries are experiencing economic crises. In practically every country, including Indonesia, the coronavirus pandemic affected all industrial sectors except consumer goods. The public still requires and purchases daily necessities, so the performance of consumer goods companies is not significantly impacted. Sales might be declined, but the change was not significant. PT Unilever Indonesia Tbk (UNVR) was one of the companies that was not significantly affected by the pandemic. Consequently, the goal of this study is to assess the financial performance of UNVR and apply the paired t-test to determine if there is a statistically similar or have insignificant difference between financial performance before and after the economic crisis. The data were taken from twelve periods of UNVR financial reports: before (Q1 – Q4 2017 to Q1 – Q4 2019) and after the crisis (Q1 – Q4 2020 to Q1 – Q4 2022). The results demonstrated that liquidity, solvency, profitability, and activity have no significant difference between before and after the pandemic.

Keywords: Financial Ratios, Paired t-test, Economic Crisis, and Consumer Goods

INTRODUCTION

In December of 2019, a COVID-19 was found in mainland China, a fact that is widely known by the vast majority of people around the world. For the last three years, from 2020 to 2022, every continent in the world was affected by this extremely contagious disease, with more than one million cases recorded in more than two hundred countries globally.

The COVID-19 pandemic affects all industries in almost every country, including Indonesia. The COVID-19 virus was thought to have entered Indonesia in mid-March 2020 after originating in China. Most Indonesian provinces implemented strict social restrictions soon after the warning was issued. It impacts both the health and economic sectors. The pandemic has impacted the community's way of life by extending operational hours and fieldwork involvement, causing widespread layoffs, and decreasing public consumption, resulting in negative effects on economic growth. The impact of the pandemic on consumer goods, being daily necessities, was minimal.

Tambunan (2020) found that investors are choosing to invest in stocks from the consumer, telecommunications (data and towers), and health (pharmaceuticals and hospitals) sectors during the COVID-19 pandemic. This supports Maslow's (1970) theory that fulfilling basic physiological needs is crucial, particularly in times of economic instability.

Figure 1 demonstrates that in 2020, as a result of regulations imposing extensive social limitations, economic growth plummeted to -2,07 percent.

Figure 1 : Indonesian Economic Growth
Source : Central Bureau of Statistics (2022)

The Kantar Report on Indonesia's FMCG Industry in 2022 highlights its significant contribution to the country's economy as a large-scale industry. Increased purchasing power due to higher income and urbanization are key drivers of growth in the sector. This industry experienced minimal impact during the COVID-19 pandemic. The FMCG market value in Indonesia rose by 5.9% in Q3 2022 compared to the same period in the previous year.

6th International CEO Communication, Economics, Organization & Social Sciences Congress

The Indonesian FMCG market has grown rapidly due to increasing population demand and changing lifestyles. It is now one of the fastest-growing FMCG markets in Southeast Asia. Since 2018, FMCG products have accounted for almost 20% of total household expenditures in Indonesia. During Q4 2021, the average consumer spending per trip increased in all FMCG segments in the country, with the food segment showing the highest change. In Q4 2021, traditional trade held a 68% market share as the primary distribution channel for FMCG products in the country. The FMCG sector in Indonesia is controlled by global and local companies. Unilever Indonesia and other global corporations have expanded the personal care and food product offerings for Indonesian consumers.

The Indonesian FMCG market remains strong despite the COVID-19 pandemic, based on consumer behavior. The average number of items purchased per trip increased in all FMCG segments during this period, with the home care segment showing the highest growth.

Company Profile of PT Unilever Indonesia Tbk

PT. Unilever Indonesia Tbk (UNVR) was established as Lever's Zeepfabriken N.V. on December 5, 1933 and later renamed to PT. Unilever Indonesia in 1980. Unilever Indonesia became a publicly traded company in 1981 and its shares were listed on the Jakarta and Surabaya Stock Exchanges on January 11, 1982. Currently, UNVR is one of Indonesia's leading Fast Moving Consumer Goods companies and the eighth largest company on the IDX by market capitalization.

Home & Beauty Personal Care and Foods & Refreshment are the two major divisions of UNVR's business. UNVR has accompanied and contributed to Indonesian societies for nearly 90 years via Unilever Indonesia's program and product line, which includes world-renowned brands such as Bango, Clear, Dove, Lifebuoy, Lux, Molto, Pepsodent, Rexona, Rinso, Royco, Sunlight Sunsilk, Vaseline, Wall's and many others. Every day, millions of Indonesians all over the country use Unilever Indonesia's brands. In addition to helping people look good, feel good, and get more out of life, these brands communicate the company's commitment to a sustainable future by supporting actions that have positive impacts on the lives of millions of our stakeholders.

1. LITERATURE REVIEW

Financial Ratio

According to (Ross et al., 2010), the financial ratio was a calculation that used variables commonly found on financial statements to assess and measure the performance of each department and manager of a multi-level company, to evaluate the competitiveness of rivals, and to forecast the future by providing historical financial information to potential investors. The financial performance of a firm is a description of the company's financial status through time, both in terms of providing funds and in terms of distributing funds (Rhamadana, 2016). Financial ratio analysis (FRA) is a good way to evaluate a company's performance.

(Megaladevi, 2015). The ratio is a measure of a company's operations on a relative basis. The purpose of financial ratios is to examine financial statements (Brigham et al., 2014).

FRA is based on an accountable analysis of data, particularly the balance sheet, income statement, cash flow statement, and statement of financial position (Cubaque-zorro et al., 2014). According to Ptak-Chmielewska & Matuszyk (2018), evaluating financial performance will help the company to identify its previous financial condition, learn its past mistakes, and maintain every single aspect that had been excellently done by the company in order to perform better in the future. To gain insights of the financial health of a company, financial analysts usually use financial ratio analysis as a tool to evaluate the company's operational efficiency, liquidity, solvency, and profitability through the three financial reports mentioned above (Bloomenthal, 2020). Henry et al., (2012) mentioned that there are five common categories of financial ratios, they are activity ratios or also called efficiency ratios, liquidity ratios, solvency ratios, profitability ratios, and valuation ratios. In this study, only a handful of financial ratios, including profitability ratios, solvency ratios, activity ratios, and liquidity ratios, are used to evaluate the financial performance before and after the pandemic covid-19.

2. CONCEPTUAL FRAMEWORK

The conceptual framework is a structure which the researcher believes can best explain the natural progression of the phenomenon to be studied (Camp, 2001)

In a statistical context, the conceptual framework describes the relationship between an investigation's key concepts. It is organized logically to help provide a picture or visual representation of how the ideas in a study relate to one another (Grant & Osanloo, 2014).

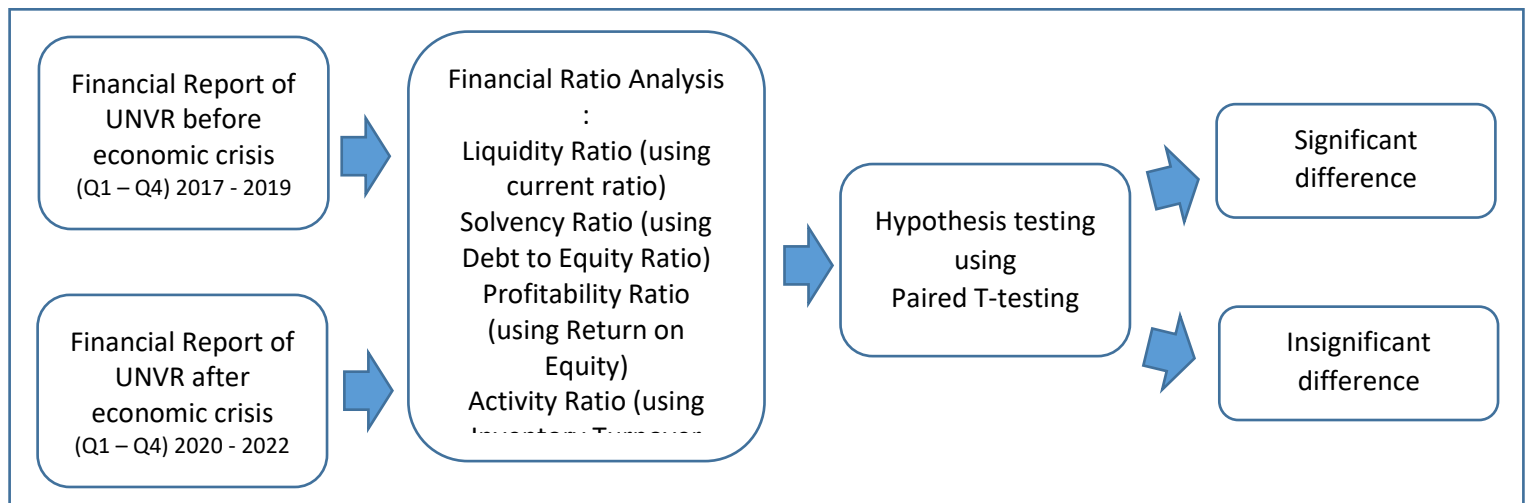

Figure 2 : Conceptual Framework

Source : Daryanto, W.M and Aprilia, O (2021).

The analysis of liquidity ratios, solvency ratios, profitability ratios, and activity ratios will be examined in this study, as illustrated in Figure 4. This study uses the financial report of UNVR before and after the economic crisis as its data source (Q1-Q4, 2017-2022). The paired t-test will be used to determine whether there is similarity or an insignificant difference between before and after the economic crisis.

3. HYPOTHESIS

Developed from the literature review these hypotheses are tested in this research as follow:

3.1 Liquidity ratio

Current Ratio (CR)

H0: There is no significance difference on Current Ratio before and after economy crisis in 2020 - 2022

H1: There is significance difference on Current Ratio before and after economy crisis in 2020 - 2022

3.2 Solvency Ratio

Debt to Equity Ratio (DER)

H0: There is no significance difference on DER before and after economy crisis in 2020 - 2022

H1: There is significance difference on DER before and after economy crisis in 2020 - 2022

3.3 Profitability Ratio

Return on Equity (ROE)

H0: There is no significance difference on ROE before and after economy crisis in 2020 - 2022

H1: There is significance difference on ROE before and after economy crisis in 2020 - 2022

3.4 Activity Ratio

Inventory Turnover (ITO)

H0: There is no significance difference on ITO before and after economy crisis in 2020 - 2022

H1: There is significance difference ITO before and after economy crisis in 2020 - 2022

4. METHODOLOGY

4.1 Research Planning

This is quantitative research, which is the systematic scientific study of parts and circumstances and their interdependencies. Quantitative research seeks to develop and apply mathematical models, theories, or hypotheses pertaining to phenomena (Sekaran and Roger, 2017). Quantitative research methods can be defined as a research method based on positivism that is used to examine specific populations and samples, sampling techniques are generally conducted randomly, data collection uses research instruments, and data analysis is quantitative or statistical to test predetermined hypotheses (Sugiyono, 2013).

4.2 Data Collection

The data which was collected for this research are secondary data. Secondary data are data that have been processed and presented by third parties. In this study, secondary data consists of the financial report of UNVR for Q1-Q4 of 2017-2022. The information obtained from the Unilever

Indonesia's official website: www.unilever.co.id and official website of Indonesia Stock Exchange : www.idx.co.id.

4.3 Data Analysis

This study employs financial ratio analysis and statistical analysis to analyze the data. Analysis of financial ratios reveals the performance of a company over a period of time, using ratios such as liquidity ratio, solvency ratio, profitability ratio, and activity ratio. In addition, a paired t-test was used to determine whether there was similar or have an insignificant difference between the period preceding and following the 2020 - 2022 economic crisis. The paired t-test was conducted using quarterly and annual financial reports as the source of ratio data.

4.3.1 Analysis of Financial Ratios

These are the formulas for the financial ratio analysis variables:

Table 1. Formulation of Financial Ratio

LIQUIDITY RATIO	
Current Ratio	(Current asset/current liabilities) x 100%
SOLVENCY RATIO	
Debt to Equity Ratio	(Total Liabilities/Total Equity) x 100%
PROFITABILITY RATIO	
Return on Equity	(Earning after Tax/Total Equity) x 100%
ACTIVITY RATIO	
Inventory Turnover	(Cost of Goods Sold/ Average of Inventory) x 100%

Source : Subramanyam (2014)

4.3.2 Paired T-test

The paired t-test is used to determine whether there is a significant difference in performance before and after a certain event between two samples that are related (Sekaran, 2017). According to Neil (2010), a paired samples t test is a hypothesis test that determines if the population means of two dependent groups are identical. Initially, the researcher selects a sample of paired observations from both groups. Consequently, each observation in each group is paired with an observation from the other group. The researcher then calculates the difference between each of these paired observations and conducts a one-sample t test using the following formula:

$$t = \frac{\bar{x}_d}{s_d / \sqrt{n_d}}$$

d : the sample mean difference score

S_d : the sample standard deviation of difference scores

n_d : the number of paired observations in the sample (i.e., the number of difference scores).
 t-value : the probability whether a difference existed before and after a given event.

This study used the paired t-test to compare the financial performance of UNVR before and after the economic crisis caused by the COVID-19 pandemic to determine if there was similar or have an insignificant difference. The timeline will be divided into two sections, the first using data from Q1 to Q4 of 2017 - 2019 for UNVR's financial performance, and the second using data from Q1 to Q4 of 2020 - 2022 for UNVR's financial performance. SPSS 27 is used to calculate the paired t-test.

Decision criteria based on the results of the Paired T-test:

1. If the two-tailed significance value < 0.05, there is a significant difference between the pre-test and post-test.
2. If the two-tailed significance value > 0.05, there is an insignificant difference between the pre-test and post-test.

5. EMPIRICAL RESULTS AND DISCUSSION

5.1 Liquidity Ratio Analysis

The current ratio which represents Liquidity Ratio has experienced a downward trend from 0.73 in 2018 to 0.61 in 2022, which is based on the annual financial statement as shown by the graph below (Figure 4). Quarterly, the pattern each year is relatively similar, and there has been a slight decline from 2018 to 2022, as the fourth quarter of 2018 was 0.73, then 0.65 in Q4 2019, 0.66 in Q4 2020, 0.61 in Q4 2021, and 0.61 in Q4 2022 as shown by the graph in the Figure 3.

The pandemic from 2020 to 2022 caused a decrease in the current ratio due to a significant increase in short-term obligations, particularly in 2021, while current assets decreased slightly. UNVR's current ratio is less than 1, indicating a challenge in fulfilling short-term obligations.

Figure 3 : Quarterly Current Ratio of UNVR
 Source : Financial report of UNVR processed by Ms. Excel 365

Figure 4 : Annual Current Ratio of UNVR
Source : Financial report of UNVR processed by Ms. Excel 365

5.2 Solvency Ratio Analysis

The Debt-to-Equity Ratio connotes solvency (DER). From the graphs below (Figures 5 and 6), it can be seen that the trend graph for DER of UNVR from 2018 to 2022 is upward, while the trends for each quarter are relatively similar. The reason why DER is increasing is because total liabilities are increasing, and total equity is decreasing. The decline in total equity resulting from the expansion of net working capital, while the rise in total liabilities is due to an increase in accounts payable, deferred taxes, and long-term employee benefits.

The financial performance of DER prior to the crisis was 2.65 , 1.75 and 2.91, and its performance after the crisis was 3.16 , 3.41 , and 3.58 annually. DER of UNVR is greater than 1, indicating that the company was riskier because every 3.6 rupiah of its debt can only be repaid with 1 rupiah of its equity.

Figure 5 : Quarterly Debt to Equity Ratio of UNVR
Source : Financial report of UNVR processed by Ms. Excel 365

Figure 6 : Annual Debt to Equity Ratio of UNVR
Source : Financial report of UNVR processed by Ms. Excel 365

5.3 Profitability Ratio Analysis

In figures 7 and 8, Return on Equity represent the Profitability ratio. From 2017 to 2022, the trend graph for UNVR's ROE was relatively stable, and the trends for each quarter were relatively similar. There is no specific number of measurements in ROE. A higher ROE indicates that a business is more effective and efficient at managing its equity to generate profits, while a lower ROE indicates that there is room for improvement.

Prior to the crisis, the annual Return on Equity performance was 1.35, 1.23 and 1.40 in 2017, 2018 and 2019, respectively, and after the crisis, it was 1.45 , 1.33 and 1.34 in 2020, 2021 and 2022, respectively.

Figure 7 : Quarterly Return on Asset Ratio of UNVR
Source : Financial report of UNVR processed by Ms. Excel 365

Figure 8 : Annual Return on Asset Ratio of UNVR
 Source : Financial report of UNVR processed by Ms. Excel 365

5.4 Activity Ratio Analysis

In figures 9 and 10, the Inventory Turnover Ratio represents Activity (ITO). From the graph below, it can be seen that ITO in 2019 was better than in 2018, but from 2019 to 2021, the trend was declining and whereas the quarterly trends were fairly similar. The decreasing ITO ratio mirrored the decline in sales during the pandemic, but the ITO ratio in 2021 was higher than in 2018, when the pandemic had not yet begun.

Prior to the pandemic, the financial performance of the Inventory Turnover Ratio in 2017, 2018 and 2019 was 8.35, 7.79 and 8.60, and after the pandemic, it was 8.33, 8.12, and 8.44 in 2020, 2021, and 2022 respectively. Similar to the ROE, there is no minimum number of measurements for the Inventory Turnover Ratio; however, the higher the number, the greater the financial performance of the Inventory Turnover Ratio. Because the higher the number, the quicker the company was able to convert its inventory into sales.

Figure 9 : Quarterly Inventory Turnover Ratio of UNVR
 Source : Financial report of UNVR processed by Ms. Excel 365

Figure 10 : Annual Inventory Turnover Ratio of UNVR
Source : Financial report of UNVR processed by Ms. Excel 365

5.5 Paired T-test Analysis

Tables 2 and 3 demonstrated the results of UNVR's Paired T-test. The pre-test uses data from UNVR's financial report 2017-2019 for Q1-Q4, while the post-test uses data from the financial report 2020-2022 for Q1-Q4. The author processes the data using IBM SPSS Statistics 27.

It presents quarterly data results:

1. Current Ratio has a mean value of 0.05, a standard deviation of 0.1188, and a significance value of 0,887. Because the sig of Current Ratio > 0.05 , it can be concluded that the Current Ratio does not differ significantly before and after the economic crisis in 2020 - 2022.
2. The mean Debt-to-Equity ratio is -0.5483 the standard deviation is 0.7931, and the significance is 0.036. Because the significance of DER is $0.036 < 0.05$, it is concluded that DER differs significantly before and after the economic crisis in 2020 - 2022.
3. The Return on Equity Ratio has a mean of -0.0025 and a standard deviation of 0.1188 and its significance is 0.943. Given that the sig of ROA is $0.943 > 0.05$, it can be concluded that ROE does not differ significantly before and after the economic crisis in 2020 - 2022.
4. The mean Inventory Turnover Ratio is 0.1908, standard deviation is 0.4610, and significance is 0.179. Because sig of ITO is $0.232 > 0.05$, it is concluded that ITO does not differ significantly before and after the 2020-2022 economic crisis.

From the four ratios presented below, it can be concluded that three of them, namely the Current Ratio, Return on Equity, and the Inventory Turnover Ratio, have no significant difference in the company performance before and after the crisis in 2020 - 2022 and only one of them, the Debt to Equity Ratio has significant effects prior to and following the economic crisis in 2020 - 2022. While In the paired t-test of the annual UNVR ratio, all ratios had sig results > 0.05 , indicating that there are no significant differences between financial ratios before and after the crisis in 2020 - 2022.

Table 2. Paired T-test of Quarterly UNVR Financial Ratio

Financial Ratio	Status	Mean	Std.Dev	Sig	Results
Current Ratio	Pre & Post	0.0050	0.1188	0.887	Insignificant
Debt to Equity Ratio	Pre & Post	-0.5483	0.7931	0.036	Significant
Return on Equity Ratio	Pre & Post	-0.0025	0.1188	0.943	Insignificant
Inventory Turnover Ratio	Pre & Post	0.1908	0.4610	0.179	Insignificant

CONCLUSSION/ RECOMMENDATION

Conclusion

The financial performance of PT Unilever Indonesia Tbk before the economic crisis in 2017-2019 (Q1-Q4) relatively stable in its Current Ratio, Inventory Turnover and Return on Equity while its Debt to Equity Ratio is increasing. Moreover, the performance After the economic crisis of 2020-2022 (Q1-Q4), PT Unilever Indonesia Tbk faced a decline in its Current Ratio, Return on Equity, and Inventory Turnover, although the decline from 2019 to 2020 and from 2020 to 2021 was not significant. In contrast, the Debt-to-Equity Ratio experienced an upward trend during 2019 - 2022 due to rising total liabilities and falling total equity.

After the economic crisis in 2020-2022 (Q1 – Q4) which, although it did not have a significant impact on the consumer goods industry, still caused the financial performance of the Current Ratio, Debt-to-Equity Ratio, Return on Assets and Inventory Turnover to decline slightly from 2019 until 2021 and increase slightly in 2022 due to the loosen restriction on community activities. The longer the government implements restrictions on community activities, the greater the negative impact on the private sector, especially consumer goods that are highly dependent on people's spending power.

According to the results of the paired t-test, there is no significant difference in the annual ratio for all ratios, indicating that the COVID-19 pandemic crisis has little effect on consumer goods. In quarterly ratios, Current Ratio, Return on Equity and Inventory Turnover Ratio have no significant differences before and after the 2020-2021 economic crisis while Debt-to-Equity Ratio Ratio has significant difference before and after the 2020-2021 economic crisis.

Recommendation

In view of the intense competition in the FMCG sector and the economic crisis caused by the Covid 19 pandemic, UNVR is recommended to increase the accessibility and availability of its products on markets, particularly those outside of Java, where economic growth is faster than in Java, which is beginning to mature. The availability and ease of purchasing products must be supported by the ease of purchasing products online from various platforms, either organic or marketplace based.

From the perspective of financial management, UNVR is still constrained by the impact of the pandemic and the Russia–Ukraine war on the price of raw materials. Consideration should be given to the pricing policy in order to maintain or even acquire new customers. In addition, UNVR should maintain current short- and long-term forecasts, ensure that all forecasts have been updated to reflect the current situation, and ensure that if a potential financial problem arises, the manager can respond to it promptly. Due to the firm's low liquidity ratio, managers must conduct liquidity tests, such as a sensitivity analysis of the cash flow statement and identify alternative sources of financing. Managers can also assess the impact of capital allocation and budgeting projects on the firm's cash and liquidity, after which they can reduce operating costs in order to manage cash flow.

LIMITATIONS

Since the economic crisis is no longer exists, there is a limitation of information, particularly in the financial report used by the researcher, which only covers the Q1 – Q4 of 2017 - 2019 before crisis and the Q1 – Q4 of 2020 and 2022 after crisis. This study is limited to PT Unilever Indonesia Tbk during the years 2017-2022. Only secondary data was used for this analysis gathered from Unilever's website and the Indonesian Stock Exchange.

ABSTRACT

The objective of this study is to investigate the impact of transformational leadership (TL) and delegation of authority (DA) on individual performance (IP) through the mediating role of individual adaptability (IA) at PLN Indonesia Power, a subsidiary of the state-owned company PT. PLN. As a power plant operator and energy solution developer, PT. PLN Indonesia Power is facing multiple challenges due to the rapidly evolving business environment, including the global target to accelerate the adoption of renewable energy, the demand for advanced technologies to enhance power supply and distribution efficiency, and the company is facing a significant decline in market share, falling from 48.92% in 2003 to 19.1% in 2021, according to the annual report of PLN Indonesia Power. To analyze the data in this research, descriptive and inferential statistical analyses were conducted using SPSS and SmartPLS 4 software. The study's results indicate a statistically significant positive impact of transformational leadership and delegation of authority on individual adaptability, and of transformational leadership and individual adaptability on individual performance. Furthermore, individual adaptability plays a positive significant mediating role between delegation of authority and transformational leadership on individual performance at PLN Indonesia Power. This study recommends that organizations invest in leaders who communicate a clear and positive vision of the future, encourage innovative problem-solving approaches, and foster trust, involvement, and cooperation among team members. Additionally, organizations should prioritize developing individual adaptability and delegation of authority to enhance their market share, the reliability of the electricity supply, and to develop renewable energy.

Keywords: Delegation of Authority, Transformational Leadership, Individual Adaptability, Individual Performance, Human Resource.

1. Introduction

The government targets net-zero emissions in 2060. The Business Plan for Provision of Electric Power (RUPTL) 2021-2030 is one of the roadmaps to realize PLN's business transformation, namely the transition to clean energy. The closest target aimed by PLN in the Transition to Net Zero Emissions is to achieve an NRE energy mix of 23% by 2025 (Electricity Supply Business Plan (RUPTL, 2021-2030)).

Figure 1 Indonesia's Projection of the energy mix

In the next ten years, PLN plans to increase its generating capacity to 40.6 GW, with a targeted addition of NRE technology plants reaching 51.6 percent of this amount, which is equivalent to 29.6% of the target for additional generating capacity. Of course, the execution of this plan will always consider the project's economics to reduce the cost of electricity supply, balance supply and demand, and ensure the readiness of the electricity system (Annual Report PT PLN Persero 2021)

Figure 1 Growth Projection of Power Generation until 2030 (Tera Watt Hour/TWh)

PLN Indonesia Power continues to innovate to meet the electricity needs of the Indonesian people by developing and increasing the reliability of the electricity supply,

including developing electricity from renewable energy, by continuing to build electricity infrastructure optimally and efficiently (Annual Report PT PLN Persero 2021). The overall trend of power generation growth is increasing, and the independent power producers (IPP) market share has also increased significantly. However, the trend of PLN Indonesia's power market share has decreased from 49% in 2013 to 19% in 2021 (Annual Report of PT PLN Indonesia Power, 2008-2021), it can be seen from the picture below:

Figure 2 Market Share of Power Generation on the Java-Bali system

2. Literature Review

a. Individual Adaptability

The dramatic rise of globalism and organizations' continued expansion into foreign markets has led to a need to adapt to people with different cultures and languages (Cascio, 2003). There is a considerable amount of research that aims to define and explain adaptability and which characteristics make up an adaptable person (e.g., Boylan & Turner, 2017; Ployhart & Bliese 2006; Pulakos, Arad, Donovan, & Plamondon 2000; Junt, Shoss, & Huang 2014).

b. Individual Adaptability and Performance

Many leaders in organizations still believe that individuals who are high in adaptability perform better compared to those who are not. Furthermore, because technology is consistently changing and being invented for various uses, organizations are seeking out people who are going to be able to adapt and learn to use new technology easily (Huang, Ryan, Zabel, & Palmer, 2014).

A significant finding from the research was that project managers are adaptable despite its absence from the main project management standardised competencies in both knowledge and performance. This research extends Pulakos et al. (2000) taxonomy of adaptive performance by statistically validating the presence of uncertain and unpredictable work situations as a dimension found in project managers. Other notable findings found justifications for combining handling emergencies or crisis situations and handling work stress as one dimension, and the inclusion of an additional dimension for demonstrating leadership performance (Ellen Mc Loughlin, Anushree Priyadarshini, 2021).

c. Delegation Authority

The research suggests that delegation of decision rights and trust are important drivers of ... performance. The study offers a new perspective on the relationship between formal governance through decision rights delegation and trust. Based on the embeddedness view, trust is a facilitator of information sharing, joint problem solving and delegation of decision rights in franchise networks, thereby increasing the positive performance effect of decision rights delegation (Marc Herz, Clemens Hutzinger, Haris Seferagic, & Josef Windsperger, 2016).

d. Delegation Authority And Individual Performance

The results from that study demonstrated that employee with high intrinsic motivation tend to be more responsible in job attributed finally ends up by performing better, in another hand the employee with low intrinsic motivation is less engaged to the job. This explains that at Burundi Tea Company, employees perceive delegation of authority has a significant effect on their levels of performance. For that, employee delegated for being in charge of any level of the company or get any responsibility for others seem to be more motivated and strive to increase the performance of the company (Eric Irakoze & Kashosi Gad David, 2019).

Effective delegation provides psychological empowerment and a collaborative, co-ordinated and comprehensive managerial technique for motivating and evaluating employees over their performance. It enhances self- confidence and reduces power distance necessary for employees to seek performance feedback from managers. 90 respondents participated in the study conducted through the exploratory research design and the result showed positive relationship between effective delegation and employee performance (John Nkeobuna Nnah Ugoani 2019).

The managers rely on delegation of authority on the abilities and skills of employees and their participation in solving problems and administrative decisions. Also encourages the delegation of authority in the routine administrative work, as well as the delegation of administrative authority increases the motivation of employees and the completion of work on time (Tayseer Said Zatar , 2018).

e. Delegation Authority And Individual Adaptability

Risk-taking did not show the typical correlations with the entrepreneurial variables as in the general entrepreneurship literature (e.g., Hisrich et al., 2007; Nieß & Biemann, 2014; Stewart & Roth, 2001) was surprising as entrepreneurs are typically seen as risk-takers. It might be fruitful to delve into this topic in future refugee studies, particularly as there is such an increased interest in unlocking the entrepreneurial spirit in migrants and refugees (Baycan-Levent & Nijkamp, 2009).

Proactive personality was found to moderate the positive relationship between career competencies and career adaptability, with this relationship being stronger amongst employees with less proactive personalities. However, proactive personality insignificantly affected career adaptability (Ahmed Khamis AlKhomeiri, Khalizani Khalid and Norwahida Musa, 2020).

f. Transformational Leadership

Recent research has focused on leadership at multiple levels, including top managers, mid-level managers, and even influential employees, as they serve as change agents and role models for employees during uncertain circumstances (Stouten et al., 2018). Transformational leadership also increase positive attitudes towards organizational changes (Seo et al., 2012; in Agote et al., 2016), as well as creative problem solving

and performance (Mahmood et al., 2019), inducing an interest to examine its effect on different dimensions of individual AP.

The theory of TL was initially developed by Burns (1978), emphasizing the importance of meeting follower needs and desires through behavioral patterns creating new solutions, and a good organizational climate (Ghasabeh et al., 2015). A globalized business environment in constant change puts pressure on leaders' roles to create a shared and inspiring vision for the organization in line with developing environments. Leadership has for a long time been characterized as a social exchange relationship between leaders and followers, recognizing a need to include followers' affective involvement. A study presented by Ghasabeh et al. (2015), argues how TL recognizes the critical role of employees' attitudes and values towards participating and supporting change at organizational levels.

g. Transformational Leadership and Individual Performance

Theoretically, work satisfaction has a relationship with work performance. Hettiarachchi and Jayathura (2014) stated that an individual with a high level of organizational commitment will show positive behavior toward the organization, give the best they can, sacrifice, and have a high level of loyalty to the organization, and also have a willingness to stay in the organization. This means that the individual with a high level of organizational commitment makes an effort to show excellent achievement (high level of work performance). On the other hand, an individual with a low level of organizational commitment tends to show no care and irresponsibility to accomplish the work (low level of work performance).

In some previous research, the variable of transformational leadership is stated to be able to positively impact some output of human resources in an organization. Through this study, the explanation and confirmation of this case strengthen the existing concept. The other variables used in this study include work satisfaction, organizational commitment, and work performance... (Anis Eliyana, Syamsul Ma'arif, Muzakki, 2019).

Through charisma, inspirational motivation, intellectual stimulation, and individualized consideration, transformational leaders create an environment where employees develop a sense of organizational identification and have a more positive leader-member exchange relationship. Also, employees should be more effective in the organization, more satisfied, and more productive (Neuza Ribeiro, İlhami Yücel, Daniel Gomes, 2018).

Transformational leadership is a leadership style focused on inspiring, encouraging, and leading by example while developing individual followers' potential. In the present study, the extent to which followers perceived their leader acting in a transformational way was positively related to followers' job satisfaction and their perceptions of their collective performance. Moreover, transformational leadership is also negatively associated with conflict in the workplace. In turn, the conflict has negative effects on both satisfaction and performance. In the present study, we sampled a team of highly qualified experts performing closely together (i.e., orchestra musicians). We used musicians' self-reports to understand the roles of relationship and task conflict as possible mediators of how followers' perceptions of leaders' transformational leadership are related to followers' job satisfaction and collective performance. (Jana Kammerhoffa, Oliver Lauensteina, Astrid Schütza*, 2019).

h. Transformational Leadership and Individual Adaptability

The relationship between transformational leadership and innovative work behavior was moderated by trust and uncertainty avoidance in such a way that transformational leadership had the strongest positive relationship with creative work behavior when trust and uncertainty avoidance were both high (Bilal Afsar and Mariam Masood, 2017)

Many academics and scholars have found that transformational leadership is particularly effective in promoting employees' innovative work behavior. Still, it has been suggested that the relationship between transformational leadership and creative outcomes is dependent on a host of factors and therefore is likely to be more complicated than previously thought (e.g., Afsar, Badir, & Bin Saeed, 2014; Pieterse, van Knippenberg, Schippers, & Stam, 2010; Reuvers, Van Engen, Vinkenbunrg, & Wilson-Evered, 2008).

This study adapted uncertainty avoidance in individuals from a social perspective, according to which it is the degree to which individuals generally have psychological comfort under ambiguous, uncontrollable, and uncertain situations at the societal level. It defines that when faced with conflicting situations, unknown risks, bad ideas, or unexpected results, how society helps individuals avoid such problems by establishing formal rules, providing more excellent career stability, not tolerating deviant thoughts and behaviors, creating an environment of trust and empowerment, and believing in more excellent optimal experiences and perceptions of self-efficacy, and lower anxiety (Hofstede, 1980, p. 49).

3. Research Design and Methodology

I develop an example of a framework to investigate delegation authority and transformational leadership with individual performance and the mediating effect of individual adaptability (see figure 3)

Figure 3. delegation authority and transformational leadership with individual performance and the mediating effect of individual adaptability.

Research Hypotheses

Based on the research framework, there are several hypotheses to examine:

H1: How does delegation of authority affect individual performance?

H2: How does transformational leadership affect individual performance?

H3: How does transformational leadership affect individual adaptability?

H4: How does delegation of authority affect individual adaptability?

H5: How does individual adaptability affect individual performance?

H6: How does delegation of authority significantly mediating by individual adaptability toward individual performance?

H7 : How does transformational leadership significantly mediating by individual adaptability toward individual performance?

4. Conclusion

The purpose of this study is to examine the impact of delegation of authority (DA) and transformational leadership (TL) on individual performance (IP) through the mediating role of individual adaptability (IA). The final sample consists of 126 respondents from the population of managerial level employees in PT PLN Indonesia Power. This research has achieved its objective of explaining the hypotheses by examining the relationships between the variables involved. Based on the analysis and testing of the hypotheses, the results of the research can be summarized as follows:

1. First Hypothesis which stated that there is a significant effect of delegation of authority (DA) on individual adaptability (IA) is accepted, the correlation between variables has t-values (5.068) and p-value (0.000).
2. Second Hypothesis which stated that there is a significant effect of delegation of authority (DA) on individual performance (IP) is not accepted, the correlation between variables has t-values (1.298) and p-value (0.194) more than 0.05 (at = 5%), and the lower bound is -0.102 and the upper bound is 0.301, the coefficient would not be significant, because the confidence interval includes zero As a result.
3. Third Hypothesis which stated that there is a significant effect of transformational leadership (TL) on individual adaptability (IA) is accepted, the correlation between variables has t-value (2.447) and p-value (0.014).
4. Fourth Hypothesis which stated that there is a significant effect of transformational leadership (TL) on individual performance (IP) is accepted, the correlation between variables has t-values (2.868), and p-value (0.004).
5. Fifth Hypothesis which stated that there is a significant effect of individual adaptability (IA) on individual performance (IP) is accepted, the correlation between variables has the t-value (2.239) and p-value (0.025).
6. Sixth Hypothesis which stated that there is a mediating effect of individual adaptability (IA) on delegation of authority (DA) and individual performance (IP) is accepted, the correlation between variables has t-values (2.031), and p-value (0.042).
7. Seventh Hypothesis which stated that there is a mediating effect of individual adaptability (IA) on transformational leadership (TL) and individual performance (IP) is accepted, the correlation between variables has t-values (1.451), and p-value (0.147) more than 0.05 (at = 5%), however it would be considered significant since zero does not fall into this confidence interval, with 0.008 as the lower bound and 0.234 as the upper bound (95% confidence interval).

ABSTRACT

According to the study on history of health nursing services, it is estimated that around 2-3% out of people in Indonesia suffer from severe mental illness. Half of them need hospital care, therefore the numbers lie on as many as 120 thousands of people who suffer from severe mental illness and must as well get serious treatment from a mental health institution. Madani Mental Health Care takes an active role in saving the nation and the young people from the dangers of misuse of Narcotics, Alcohol, and Addictive Substances and also directing the people with Schizophrenia in order to have a better quality of life. In this project, the author did a volunteer in the institution as an English instructor for its patients in addition to other tasks related to English affairs division. The underlying objective of Madani is to improve the life quality of patients in society, one of the ways is through providing English class. Although the current existed English class was unorganized in terms of learning curriculum, including materials and assessments, the author saw this as an opportunity for an improvement. To help Madani provide a better English class, this paper also explains about the strategy on how the project supposes to be conducted by using the principle in the Project Management. At last, after completing an analysis throughout the project, the author recommended Madani Mental Health Care should maintain the current modification of the class developed by the author.

Keywords: Mental Health, English Lesson, Caregiver, Community Involvement Project, Volunteer Work

INTRODUCTION

According to the study on history of health nursing services, it is estimated that around 2-3% out of people in Indonesia suffer from severe mental illness. Half of them need hospital care, therefore the numbers lie on as many as 120 thousands of people who suffer from severe mental illness and must as well get serious treatment from a mental health institution (Keliat & Panjaitan, 2005). Furthermore, the prevalence of severe mental disorders in Indonesia is estimated at 1.7 per 1000 population. The COVID-19 pandemic has further worsened the situation, with a reported 64.3% increase in mental health issues (Tarmizi, 2022).

Figure 1 The Mental Health Disorders Among Young Indonesians
Source: Kemenkes (2022)

After the independence era of Indonesia, in 1950, Indonesian government started to administer the mental health development program under the Health Department, which was then changed to Mental Health Directorate in 1966 that is now led by the Directorate Head of Mental Health. Then, the government is more open to modernize the whole healthcare system as well as mental health facilities in Indonesia. The initiations are shown by Mental Health Directorate doing collaboration with various government institutions, medicine schools, international organizations, national conferences, and even regional meetings. Likewise, most of private health institutions in urban areas began to consider about mental by building the mental health sanatorium in Jakarta, Jogjakarta, and Surabaya.

1. CHAPTER - BACKGROUND

1.1 Drugs

Based on World Health Organization (1969), the definition of drug is any substance that if it gets into a living organism will cause a change in one or more functions of the organism. The term that is introduced by the Ministry of Health in Indonesia is *NAPZA* in which the abbreviation containing of narcotics, psychotropic, and addictive substances. In its origins, *NAPZA* is actually a type of drugs that are useful in medicine. The function of these substances may vary, which are normally used as a general anesthesia in surgery, sometimes as tranquilizers or sleeping pills, even as analgesic or known as painkiller. It was not until 1970, at the time of the Vietnam War was in its peak, one of dangerous types of drugs which is narcotics, became a national highlight. Then, in almost every country in the world, especially in United States, the numbers of drugs abuse cases highly increased and sadly most of the victims were young people. It seemed that this phenomenon had also radiated to Indonesia in about the same time (Janos, 2018).

Figure 1.1 The Increase of Drug Abuse Prevalence in Indonesia
Source: PUSLITDATIN BNN (2020)

1.2 Schizophrenia

Schizophrenia is a mental disorder that exhibits complex and diverse range of symptoms. Schizophrenia is found in people who have a breakdown in normal thought processes as well as their emotional responses. The example of symptoms includes auditory hallucinations, paranoid, bizarre delusions, disorganisation in speech and thinking, and sometimes significant social dysfunction in a more severe case. In addition to these generic symptoms, the social function of schizophrenics often are affected through becoming withdrawn, extremely anxious, agitated and violent, mute or catatonic, having poor hygiene, and even lack of interest in daily activities (Patel et al., 2014).

Approximately 24 million people globally, equating to about 0.32% or 1 in every 300 people, are impacted by schizophrenia. The prevalence among adults is slightly higher, at 0.45% or 1 in every 222 individuals. Schizophrenia usually manifests in late adolescence or during one's twenties, with the onset typically occurring earlier in men compared to women. The mortality rate among those with schizophrenia is 2 to 3 times higher than that of the general population, often resulting from physical health conditions like cardiovascular, metabolic, and infectious diseases (WHO, 2022). The Department of Health put the number of people with severe mental disorders as in 2.6 million people, drawn from the data of Indonesian Mental Health Institution (Renwick et al., 2023).

1.3 Madani Mental Health Care Profile

Madani Mental Health Care is a rehabilitation center in Jakarta that uses community base coaching with the holistic approach of Bio-Psycho-Social-Spiritual (BPSS). It was established on the basis of awareness and responsibility to the society through applying the method invented by Prof. Dr. dr. H. Dadang Hawari, a renowned psychiatrist who is also the headmaster of Medical School in University of Indonesia. As the creator of BPSS method, he also holds the license which is recognized by World Health Organization. Oftentimes, Madani Mental Health Care is entrusted with several social projects collaborated with Indonesian National Narcotics Agency (BNN) and Indonesian Ministry of Social Affairs

Furthermore, the establishment of Madani Mental Health Care is actually a manifestation form of taking an active role in saving the nation and its young people from the dangers of misuse of *NAPZA*. Also, redirecting the people with schizophrenia and former drug users to have a better quality of life. They can be cured and prevented from the recurrence with the approach of the bio-psycho-social-spiritual - BPSS (WHO, 1984; APA, 1992; WPA, 1994).

1.3.1 BPSS Method

BPSS is an acronym for Biologic, Psychological, Social, and Spiritual (WHO 1984; APA, 1992, WPA, 1993). Based on the abbreviation of the name, the implementation of BPSS method is a mixture of those aspects mentioned with an addition in skills and interests therapy on the other side.

1.3.1.1 Biologic

In this first stage, patients will go through detoxification in order to clean their bodies from the influence resulted from alcohol and narcotic substances. The process of detoxification will require patients to stop the consumption of addictive substances and they will be put to sleep more, without anaesthetic procedure, in order to eliminate the withdrawal symptoms. Furthermore, the treatment will also involve medical therapy in the process in which patients will be prescribed to take psychiatric medication such as anti-psychotic and anti-depressant types of medicines. This method was acknowledged by United Nations as a successful method (UNODC, 2003).

1.3.1.2 Psychological

To complement medication, post-detoxification process patients will later require attending psychiatric consultation called psychotherapy in order to slowly change their maladaptive behaviours to become adaptive. In psychotherapy, the counselling session is categorized to three types; individual, group, and family. Starting by Individual session where patients describe their past experience regarding with mental illness and/or behaviours towards drugs.

Meanwhile later in supporting group session, all patients with these issues will be gathered to share their problems and help each other to get through it by figuring out the solution together. At last, each patient and their family will attend a psychotherapy session in order to identify issues in their relationship. It is crucial for the family to be able to understand the personality of patients with depth and care, thus family know how to work on them. All this therapy will take period of three months to process.

1.3.1.3 Social

The function of social therapy is to help patients maintaining a healthy living environment and relationship between patients and their surroundings. This psychosocial program is a re-entry program where patients are equipped with education and skills that will help them functioning well in school or job before going back to their community. The training includes English class, cell phone reparation, vehicle reparation, handicraft, fish cultivation, screen printing, computer, and calligraphy. On the other hand, there are also physical activities as a complementary to this social therapy such as jogging, futsal, swimming, rafting, paintball, and other outbound games.

1.3.1.4 Spiritual

The spiritual therapy is given throughout the entire program in accordance to the religious belief of patients. The objective is to correct the mind of patients that lack of common sense through encouraging them to put their belief into daily practice, hence it can be aligned with aspects of their religion values and Indonesian constitutional law.

1.4 Problem Statements

Based on the observation of the author, there were several issues happened in Madani Mental Health Care, which perhaps needs to be taken into account in order to make an

improvement for its long-term performance. The discussed issues can be seen from the following table;

Table 1.4 Problems Found at Madani

Problems	Details
Unclear curriculum of English class for patients	Inconsistency in deliverance of class materials and lack attention to the performance of patients
Low level of popularity	As the pioneer of BPSS method in country, still not many have heard the name of Madani Mental Health Care
Low level of coordination between volunteer and staff	Unclear task distribution and timetable

One of the visions of Madani Mental Health Care is to improve the quality life of its patients once they step out back to society. Some of them are still in college, few previously worked as employees, and others are still unsure what to do after. It is widely known that English nowadays becomes one of the significance factors that can help people to boost their performance and getting certain position in school, organization, and society. On the contrary, there is still unsteady curriculum regarding English class in the institution, which makes it difficult to follow up the progress of the patients. Therefore, being an English instructor becomes a great intersection point between the skill offered by the volunteer and the need of patients in Madani Mental Health Care. Additionally, since the class accommodate such patients with certain mental conditions then learning English here should be fun and practical rather than serious as in formal education.

As the pioneer of BPSS method in the country, Madani Mental Health Care undeniably has unique quality for a mental healthcare. However, whenever foreign journalists come to Madani Mental Health Care for an interview, the common problem occurred is in the communication with staff due to their poor English skill. Meanwhile, its website contents mostly covered topics in Indonesian Language (*Bahasa*). This perhaps contribute to popularity of the institution that is still unheard in wider area of society.

1.5 Objectives and Benefits of Project

1.5.1 Objectives of Project

1. To be able to complete CIP according to its established philosophy that is to conform a social responsibility as an individual to the society.
2. To explore a different industry outside business area.
3. To provide solution to the challenges faced by the English Affairs Division and improve its mechanism.
4. To share the volunteer experience that could benefit for other similar project in future.

1.5.2 Benefits of Project

1. Spread awareness to readers about mental illnesses.
2. Enrich knowledge of readers about BPSS method implemented by Madani Mental Health Care as the most effective way to treat patients with mental illnesses.
3. Obtain knowledge, skill, and real-life experience of humanitarian work in mental healthcare field for the author.
4. Bring a possible improvement to the operation of Madani Mental Health Care for its better future.

2. CHAPTER – LITERATURE REVIEW

According to CIP guideline by Sekolah Tinggi Manajemen IPMI, Community Involvement Project (CIP) is real life project, therefore it is expected for students to be practice driven and to have extended realization in regards to social lens for community which are in need. By simultaneously involving in a project, it is hoped students could bring an improvement to a performance of prospective community where CIP will be conducted, in a context of Charity, Social Entrepreneurship, as well as Corporate Social Responsibility (IPMI, 2022).

2.1 English as a Means for Communication

Communication is the centre of human activity. It is a process of sharing feelings, ideas, and opinions with other people, whether verbal or written forms. To become effective, a communicator should be able to articulate what they need to deliver in a clear, simple, competent, and dynamic nature which helps audiences to generate better understanding of messages. One of the way to ensure such an effective communication is by the quality of language skill that one possesses, for that reason, language is a tool for communication. As for any other skills, it is nearly impossible to master a particular language unless one practices it on regular basis (Tran, 2016).

As a matter of fact, English has revolutionized the world by becoming a global language. It has a status of a second language in almost all the countries in the world where it is not even the first language (Ly, 2022).

Figure 2.1 The most spoken languages worldwide 2022

Source : International Journal of TESOL & Education (2022)

In this digital era, eighty percent of computer data are processed and stored in English (Ahmad, 2016). Likewise, the role of Internet that has turned world smaller by providing flood

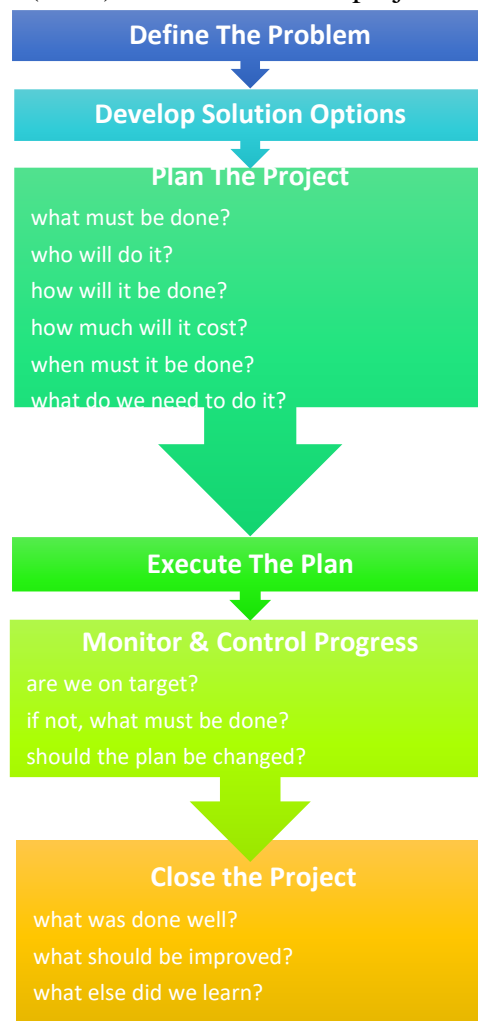

of unlimited information available in online sources as well as connecting people across the globe thru social media. All this fact, undoubtedly put English in the significant position as a language and an acknowledged passport that brings people to a better education and employment opportunities in various fields.

2.2 Theoretical Framework of Project Management Process

The PMBOK Guide definition of project management is the application of knowledge, skills, tools, and techniques to project activities to meet the project requirements. Project management is accomplished through the application and integration of the project management processes of initiating, planning, executing, monitoring and controlling, and closing, also they tend to be employed in the sequence (PMBOK Guide, PMI, 2013).

Figure 2.2 The Steps in Managing Project

New York: McGraw-Hill

3. CHAPTER - METHODOLOGY

3.1 Type of Research and Source of Data

This research will be formed as qualitative research, which of data is derived through a three-month observation of the author during the volunteer period in Madani Mental Health Care. The type of data used in this study is primary data which is obtained directly from

respondents, or in this case is patients through their class performance and the direct feedback from the supervisor in Madani Mental Health Care. Therefore, the data supports the author to find the answers that can solve the issues found in the problem statements.

3.2 Initiation of Project

The Author indeed has a huge interest in mental health for long time. Prior to start this project, the author consulted Prof. Dadang Hawari to ask permission for volunteer at Madani Mental Health Care. Later, he referred her to the head of institution, Mr. Darmawan, who is responsible for the daily operation. Then, the author set aside a schedule to meet Mr. Darmawan in Madani Mental Health Care. In the beginning of meeting, the discussion focused more on the background of the author, the major of her study, interests, and skills. English somewhat seemed to be a great intersection point for CIP, it suits her competency while also perceived to accommodate the needs of institution.

3.2.1 Identification of Problem

At the same time after Mr. Darmawan agreed to put the author in English department, he introduced the author to the person who is responsible for it, Mr. Yudo. According to them, the working culture in Madani Mental Health Care are unstructured and sometimes unpredictable, therefore adaptability is the key for the employees here. For instance, it has already a long-established English class for the patients, however in the execution, schedule was sometimes unorganized. So as for learning materials and its objectives that still remained unclear. Consequently, patients seemed to be unmotivated.

3.2.3 Developing Solution Options

On the other side, considering the schedule of English class only once a week, Mr. Yudo also thought of another option so that the author can contribute more to Madani Mental Health Care during CIP. For example, doing a translation for articles. It is still up to nowadays that reading material sources for mental health are more informative and available in English language. Madani Mental Health Care aims to educate more people on mental health issues meanwhile they slightly are limited due to their English skills. All translated articles are hoped to increase the richness of their website contents and raise the publicity level of Madani Mental Health Care itself.

3.3 Project Plan

To help formulate the plan, the author gathered several questions that needs to be resolved according to the Project Framework as follows;

1. What must be done?

The things that will be main activities of this project are to raise the awareness on the importance of English at Madani Mental Health Care, improve English ability and interest of its patients, and promote a better publicity of the institution to the outside world by adopting English as an instrument.

2. Who will do it?

The people that involve directly to navigate this project are the author as a volunteer, Mr. Yudo, head of English division, and the patients at Madani Mental Health Care as students for this course.

3. How will it be done?

The author aims to observe the nature of students before getting into the actual teaching activity. By seating in class, she aims to obtain perspectives on various matters such as knowing each

patient, number of students in class, whether they are all in the same level, the enthusiasm in the class, type of materials is taught so far, and also current learning condition. As result, she can recognize the area which needs to improve. Indeed, few early sessions are more for the process of adaptation where she presents merely as an assistant to Mr. Yudo. As a means of publicity, the author consults with the staff that is responsible for day to day administration at Madani Mental Health Care, Mr. Taufik Permadi, regarding the contents for the website. The discussion includes the platform source that is recommended to look for articles to be translated, the theme of contents that should be put, etc. Considering he is the person in charge who maintains operation of the website, thus basically he may as well validate her work before publishing it on website.

4. When must it be done?

The duration of CIP at Madani Mental Health Care takes a period of three months to process, specifically from September 20th to December 16th, 2022. The volunteering schedule is agreed to be four days a week, Monday - Thursday from 08.30 a.m. to 03.30 p.m.

Table 3.3 General Time Frame of Project

Month	Activity
Mid-September, 2022	Meet Prof. Dr. dr. H. Dadang Hawari
	Visit Madani to consult with Mr. Darmawan
	Gather ideas for volunteer activities
	Construct a project plan
September 20 th to December 16 th , 2022	Ongoing volunteer work
December 24 th , 2022	Farewell party

5. How much will it cost?

This CIP is self-fund-based; therefore, any expense occurs during the volunteer period is borne to the author who is the initiator of this project.

Table 3.3.1 Budget Details

Name	Expense	Quantity	Total Amount
Ojek transport (back & forth pick up service)	Rp. 50,000	@ 54 days	Rp. 2,700,000
Lunch	Rp. 18,000		Rp. 972,000
Paper Printing	Rp. 500	@ 13 meetings (18 pcs/meeting)	Rp. 117,000
Farewell Meals	Rp. 25,000	@ 25 boxes	Rp. 625,000
Grand Total			Rp. 4,414,000

6. What do we need to do it?

The author realizes that a success factor of project pretty much relies heavily on collaboration among the parties involved in it, namely the author, the staff, and patients in Madani Mental Health Care. Being familiar and connected with each other are the roots for better coordination,

resulted in an ease to collect more helpful information and implementation of prominent strategy that will enhance in the fruitful flow of project.

The activities that are carried out in this stage as follows; actively seeking an input from staff that supervise the author, being an approachable friend in and out the class hours to the patients whether for chit chat and especially on a subject related to English lessons, distributing a placement test to divide the class based on range of their level rather than put them in one big group, and modify the class by coming up with more fun and creative learning materials. Outside the teaching schedule, the author finds articles on an issue about mental health and works on the translations for website contents.

Overall, the author develops some insights which helps to clarify the approach of conducting the volunteer work on the beginning of project. Afterall, it is always easier to complete a task when having a roadmap in hand to keep one on track. Additionally, for the other stages of project such as execution, also monitor and control will be covered in next chapter.

4. CHAPTER - RESULT & DISCUSSION

In this chapter, the author examines the process of execution alongside some unexpected circumstances that occurred as challenges. However, having a clear set of plans from the beginning makes it easier for the author to identify the aspects to control and monitor the project in its execution.

4.1 Execution of Project Plan

Reaching up the time to implement the drafted project plan, the discussion in the next paragraphs is divided into two parts based on job descriptions. The first part talks about English class and second one is about the article translation for the website.

Soon after being introduced to the students in the class, the author is notified that there are around 15 to 20 patients who attend the course. Here are the other facts she collects from the first meeting; the course takes place in second floor of Madani Mental Health Care building. Yet, the age range of students are varied from teenage to adult age. The schedule of the class is once a week, every Thursday and the duration of class is two hours in afternoon from 1 p.m. to 3 p.m. Mr. Yudo and the author both present in class, during the first three meetings he was the main instructor while she was merely an assistant to him. Afterwards, the author realizes that it is not quite effective to put the students altogether while there are two instructors standing in front of them. Therefore, she suggested to divide the class into two groups; basic and intermediate students, Mr. Yudo agreed. She begins to set up a placement test as a method to examine the English level skills of the students. The test itself mostly consists of basic grammar and general questions.

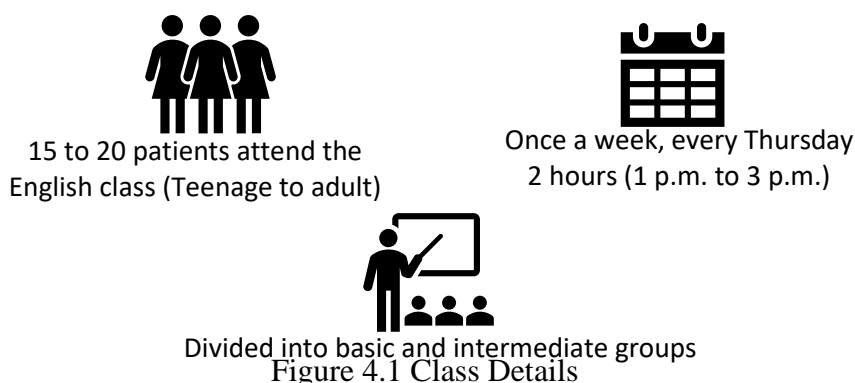

Figure 4.1 Class Details

Moreover, the author also classified materials into more structured topics such as reading, listening, speaking, and grammar, followed by some exercises at the end of every session. Exception to the reading class, it is organized in two different meetings. One session concentrates notably on comprehension of the story as well as speaking part, where students work on pronouncing the contents on reading paragraphs. Another session focuses solely on answering the questions related to the particular reading passage. As much as the author concerns to create a progress in the curriculum, she suggested to add a listening class since it was not covered beforehand.

Mr. Yudo gave an appreciative response to this idea by facilitating a tape recorder they own which can be useful to the activity. Taking into account that this listening class is relatively new to the students, therefore, the author intentionally brought on its introduction in a more fun approach. Instead of putting a serious conversational theme, she utilized music as the tool for such exercise. Here the students were expected to listen to a song and filled in the blank for those numerous lyrics that were missing on their answer sheets. The students in basic level customarily get easier vocabs to fill. At last, there was not much of a change in grammar section since the preceding English class has heavily targeted on it. Besides, considering the patients' daily schedule for other activities were already a lot, therefore the author assumed it is better not to give them an additional assignment such as homework since the patients were also required to have enough rest.

Additionally, the author is assigned to enrich contents of the website through translating English articles into Bahasa Indonesia, mainly on the issue related to mental health. Mr. Taufik as the secretary of Madani Mental Health Care was the person whom had a full capacity on administration, one of them was on the website maintenance. In this project, the author was facilitated with a desk at its office which enabled her to act as an admin staff in the institution. In the initial period of assignments, Mr. Taufik chooses himself the articles that he wanted her to translate. Besides articles, she was occasionally asked to translate some of English terms on other documents that they worked for awareness campaigns. After she gained a better understanding about the type of articles are appropriate to put, then, she began to take an initiative for selecting and proposing to Mr. Taufik regarding the prospective articles for translations.

Furthermore, the table in the next page summarizes a more specific information about the ongoing volunteer activities occurred in period from September 20th to December 16th, 2022.

Table 4.1 The Ongoing Volunteer Work Details

Schedule	Main target	Description of Activities	Involved Parties
Thursday At 1 p.m. – 3 p.m. Approximately 13 meetings	Improve the existing English Class	<ol style="list-style-type: none"> 1. Seat in for few early sessions to observe the class 2. Distribute a placement test for patients 3. Generate ideas to establish a more fun and creative approach for the class 	<ul style="list-style-type: none"> • Mr. Prayudho Utomo • Zahra Maulida • Patients of Madani Mental Health Care

in total		4. Come up with a new class arrangement. Dividing lessons into different parts; Listening, reading, speaking, and grammar	
		5. Implement an assessment through exercises for every subject material to measure the performance of students

		6. Contribute as a narrator to the making video project campaign	<ul style="list-style-type: none"> • Deny • Zahra Maulida

4.2 Monitor and Control of Performance

Based on the result of placement test, the classification of students somewhat made it easier for the instructor to keep up with the performance of every student as well as making sure that the deliverance of material reached the right target. Since an instructor is more approachable to a smaller group of students, those who were previously more shy to participate, no longer felt intimidated by the brighter students whose oftentimes dominated the session. As a result, their motivations to learn raised through being more actively engaging in interaction with the instructor and more cooperative to the peers seating next to them. A smaller group indeed enabled students to share strengths and improve their weaker skills collectively. For that reason, the class discussion has never been livelier. Hence, the ongoing situation has met the target of project plan that is to improve the performance of students in class.

On the other hand, the added value to the current class was done through spreading the learning materials into more comprehensive areas such as reading, listening, speaking, and grammar whereas previously it was limited to the grammar aspect only. The author with her conviction has succeeded on accomplishing well-arranged class and maintaining the condition simultaneously upon such proportion to the end of volunteering period.

In addition to article translations, there was a couple of other activities which occurred unpredictably during the project. These tasks include guiding a foreign journalist and another one was participating as a narrative voice over for a video campaign. Initially, Mr. Taufik and the author once had discussed about the fact that journalists from abroad frequently visit the institution. One day, a foreign journalist arrived in Madani Mental Health Care for an interview. Moreover, the interpreting part was actually an impromptu task because she had no clue on his arrival. She was then given a role to participate due to the fact that she was also part of the

institution on English department. Although Mr. Jami, as a representative from Madani, had far better knowledge on subject matter of the interview. Unfortunately, the issue was on his poor English skill. Hence, to ensure the precise and smoother articulation of his ideas, the author bridged the communication gap by interpreting the conversation between Bahasa Indonesia and English.

Moreover, there was an argumentation among some staff on the making of video campaign. This video was intended for an awareness campaign about the dangers of narcotics to young generation by Indonesian Ministry of Social Affairs. This time they thought of doing something different from previous videos they usually made. Instead of putting subtitles into the slideshows, they wanted to put a story instead by using a voice narration to describe the plot. The voice of a woman was perceived to be more presentable, therefore they asked a consent from the author to participate in this project. Since the video was a collaboration project with governmental institution, as a consequence the language was in Bahasa Indonesia. Likewise, some patients and staff also took parts in this video project. Below is the example of a patient named Deny who had a talent in video editor.

Overall, the author learned a lot on the principles of togetherness and simplicity during the period of CIP completion. Soon as the volunteer period is done, the author altogether with the staff and patients are gathered to carry out a farewell party on Saturday, December 24th 2022.

Picture 4.2 Farewell Party and Food Charity

The event began with the commencement speech from Mr. Darmawan as a head of the institution then followed by a farewell speech of the author, the Islamic lecture, food charity, and finally prayer recitation as a closing.

CONCLUSION & RECOMMENDATION

Conclusion

Madani Mental Health Care implements a unique method called BPSS to treat their patients. Most of mental institutions focus only on the cure of biological part from the mental illnesses and many of those can be indecent in their treatment method. However, Madani Mental Health Care breaks this stigma by treating patients as human beings with dignity. Not only does it help patients to recover from mental condition but also equip them with some variety of trainings. Hence, they can perform well once back to their own communities.

Furthermore, Madani provides various classes to the patients one of which is English. English is a well-matched service to a skill of the author and therein perceived an area which benefits the most for the institution. In order to keep up with the world issues, people become familiarized with computers and internet where English serves as a facilitator. As it was explained in chapter one of this paper, English is a window to the world which arguably empowers young minds who utilizing it. Therefore, if there is any skill these patients later can

develop to be better once coming back to their communities, it is through working on their communication and English skills.

At the end of the volunteering period, it is worth mention some issues which became the limitations of this CIP project. On the limitation part, she was the first student that the institution hired for the volunteer with a weekly regular schedule, oftentimes there was not much task to do in the office and the workload stream was highly unpredictable. Since they also had little to no experience in dealing with students whose background coming from outside of psychology major, hence it is understandable that everything did not always run smoothly and consistently according to the expectation. Likewise, it is undeniably difficult to set a clear expectation from the institution about the kind of improvement they wished the author brought upon the CIP completion since this is not a typical volunteer that the institution granted to a student.

Recommendation

The author suggested to Mr. Yudo to implement a more fix curriculum and creating a certain assessment to measure the performance of students from time to time for the English class. One of the examples is to develop its own syllabus that means creating a timetable of exact materials to be delivered in each meeting and determining this plan in advance prior to the beginning of class period. However, he was afraid that having such curriculum as in formal school will burden patients considering the fluctuation on their mental conditions. When experiencing herself, the author cannot deny that some patients often did not fully attend the class because the daily function of a patient was highly affected by the occurrence of their symptoms from medication. As a result, instead of putting a heavy pressure on their performance that potentially can cause a sudden burn out, it is important to keep the patients at ease and maintain the situation to be fun. Therefore, the current modification in the English class is seemingly enough and convenient to be applied for Madani Mental Health Care in the future.

Lastly, the author recommends for the volunteer schedule to be reduced in order to prevent the occurrence of similar issues in terms of time and cost efficiencies. Particularly the emphasis is on the upcoming volunteer with a self-funded project. In this case, for example, the author was placed on English division with a main focus on teaching the class. Since the class itself was only conducted once a week for two hours, therefore perhaps the work schedule should follow accordingly. Alternatively, the work schedule can also be narrowed down from four days to twice a week as a means to anticipate other additional and unexpected tasks related to English division affairs. Assuming Madani Mental Health Care finds common ground on this feedback, thereby, it also helps volunteers eliminating unnecessary costs on their budgets.

ABSTRACT

Early in 2020, during the Covid 19 era, cryptocurrency tendencies in Indonesia increased dramatically. An alternate investment was aggressively sought after by investors. However, Indonesia, especially in its capital city of Jakarta, saw a decline in the popularity of cryptocurrencies in 2022. The perception of cryptocurrency is negatively impacted by a number of issues. The goal of this study covers analyzing the influence of investors' risk perception on investing intention in cryptocurrency; analyzing the influence of investors' perception on knowledge on investing in cryptocurrency. Lastly, analyzing the effect of investors' trust perceptions on investing in cryptocurrency and testing the impact of investor's attitudes on investing intention in cryptocurrencies. The dependent variable is investment intention, and the independent variables are perceived risk, perceived knowledge, and perceived trust. The intervening variable is attitude toward behavior. All potential investors in Indonesia made up the entire population of this survey. Purposive sampling, also known as non-probability sampling, is used in this study. Only respondents who meet certain requirements can constitute the sample population in this method. SEM-PLS, which makes use of the SmartPLS software, is the analytical tool used in this work. In the end, perceived knowledge has little effect on investor attitude, whereas perceived risk and perceived trust have a substantial impact. Finally, Investor Attitude also has a significant and positive influence on Investor Intention to Invest in Jakarta's Cryptocurrency Market.

Keywords: Perceived Knowledge, Perceived Risk, Investing Attitude, Perceived Trust, Intention to Invest, Cryptocurrency, Jakarta

I. Introduction

The expansion of the financial technology sector has spurred the sharp rise in cryptocurrency investors in Indonesia. The 2008 financial crisis had a substantial impact on the banking sector. One of the many breakthroughs that have developed swiftly during the past 10 years is the use of technology in financial goods and services, or fintech. At its most basic level, fintech uses specialized software and algorithms that operate on computers and, increasingly, smartphones to assist businesses, business owners, and consumers in better managing their financial operations, processes, and lives. According to Lee and Shin (2018), the current fintech business model includes funding, payments, wealth management, capital markets, and insurance services.

Fintech is a massive phenomena that is always changing as more and more technology entrepreneurs enter the market and adapt it to satisfy social requirements. One way to think of fintech is as a financial service that uses cutting-edge technology to address the essential needs of "tomorrow": high efficiency, cost savings, the enhancement of business operations, rapidity, flexibility, and innovation (Dapp et al. 2014). On the other side, "Fintech" is also used to describe businesses — and, what is even more typical, to start-ups — that act as enablers of these kinds of services. A cryptocurrency is a type of financial technology that is notable for its use of blockchain technology. A cryptocurrency is a form of digital or virtual money that is encrypted for security, making fraud and double spending nearly impossible. Cryptocurrencies stand out because no central authority issues them, which makes them potentially immune to government intervention or manipulation (Frankenfield 2022). The operation of cryptocurrencies, which are digital or virtual currency, depends on cryptography technologies. Without the use of external payment processors, they make it possible to conduct secure online transactions. Hashing operations, public-private key pairs, and elliptical curve encryption are just a few examples of the many cryptographic techniques and encryption algorithms covered by the name "crypto".

When Satoshi Nakamoto published the initial cryptocurrency, Bitcoin, the boom of cryptocurrencies began. The currency's implementation was made available as open-source software in 2009, at which point it was put into use. Although cryptocurrencies gained popularity throughout the course of the year, particularly in Indonesia, few individuals were familiar with them or their use. In Indonesia, the blockchain and crypto asset industries have grown rapidly in recent years, according to data from the Indonesian Blockchain Association (Asosiasi Blockchain Indonesia). Badan Pengawas Perdagangan Berjangka Komoditi (Bappebti) noted that the value of crypto asset transactions in Indonesia will reach IDR 859.4 trillion in 2021. However, the rise in transactions is inextricably linked to the rise in cryptocurrency investors in Indonesia, particularly in Jakarta. It was noted that by the end of 2021, there were 11.2 million cryptocurrency investors. However, there will only be 4 million investors worldwide in 2020. This indicates a 180% growth in cryptocurrency investors over the past year or so. The value of crypto-asset transactions in Indonesia as of February 2022 is IDR 83.8 trillion. To reach 12.4 million, the number of investors has now risen by 532,102.

Early in COVID 19, there was a sharp rise in the number of investors who were buying cryptocurrency since it was seen as a viable alternative to making "easy money" by many. Due

to the increasing number of cryptocurrency investors in Indonesia, many people who lost their jobs as a result of COVID 19 attempt to invest in cryptocurrencies. Unfortunately, cryptocurrency is a volatile market just like any other. Because most of the currencies in the crypto market are high risk and high reward, many new investors rely on influencers, news, and rumors to trade in the market. However, without the right understanding, it is practically certain that they will lose all of the money they invested. Public individuals like Elon Musk have a significant impact on the price movement of several coins, including Dogecoin. Elon Musk's tweets have a significant effect on how much Dogecoins are worth. The value of Dogecoin is rapidly declining once the initial excitement has subsided. This demonstrates the necessity for additional education and practice before making snap decisions while attempting to invest in cryptocurrency. Additionally, recent studies indicate that the trend of cryptocurrency will be dropping by 2022. The cofounder and chief operating officer of TokoCrypto, Mr. Teguh Kurniawan Harmanda, stated in an interview that the worldwide market's events have a cascading impact that has led to a decline in the popularity of cryptocurrencies in Indonesia.

II. Literature Review and Hypotheses

2.1. Perceived Risk, Perceived Knowledge, Perceived Trust and Attitude Toward Investing in Cryptocurrency

How an investor will invest in cryptocurrencies is influenced by how they perceive the risk. Perceived risk is defined as "the citizen's subjective expectation of suffering a loss in pursuit of a desire outcome" (Warkentin et al., 2002). Perceived risks have an impact on an investor's capacity to apply their financial expertise to make the optimal decision. Risk perception is the process through which someone perceives information and creates a mental picture using that knowledge. As of 2019, Ainia and Lutfi. According to the results of a prior study, (Chen and Farkas 2019) predicted that, given additional empirical validation, it is anticipated that knowledge of risk perception and attitude will provide enterprises with insights into how consumers would behave in these risky situations.

One's view of or belief that they have the knowledge required to evaluate a brand's position within a category of goods is referred to as perceived knowledge. Actual knowledge is the possession of the information regarding a product's features required to select between brands in a specific product category. (1988; Park, Gardner, & Thukral). According to earlier research, a significant number of financial decisions have been demonstrated to be substantially connected with perceived financial expertise (or trust) (Tang and Baker, 2016).

Perceived trust is described as an emotional condition that results from the other person's gratifying behavior and makes one desire to trust them. Numerous research on the adoption of technology have stressed the significance of trust as a strategy to enhance customer interactions, boost credibility, and raise perceived security of the system (Liébana-Cabanillas et al., 2018). Guiso et al. (2009) concluded, based on earlier research, that those who are more trusting are more willing to invest in equities and

hazardous assets. As a result, they are also willing to allocate a higher portion of their money to stock investments.

Perceived trust is described as an emotional condition that results from the other person's gratifying behavior and makes one desire to trust them. Numerous studies on the adoption of technology have stressed the significance of trust as a tool to enhance customer connections, boost credibility, and raise perceived security of the system. (2018) (Liébana-Cabanillas et al.). Guiso et al. (2009) concluded, based on earlier research, that those who are more trusting are more willing to invest in equities and hazardous assets. As a result, they are also willing to allocate a higher portion of their money to stock investments.

The following possibilities could be developed in light of the previous explanation:

H1: Investors’ Perceived risk of Cryptocurrency have a significant effect on attitudes toward investing in Cryptocurrency

H2: Investor’ Perceived Knowledge of Cryptocurrency have a significant effect on attitudes toward investing in Cryptocurrency

H3: Investor’ Perceived Trust of Cryptocurrency have a significant effect on attitude toward investing Cryptocurrency

2.2. Attitude Towards Investing and Intention to Invest in Cryptocurrency

According to the Theory of Planned Behavior (TPB), attitudes toward a behavior, subjective norms, and perceptions of behavioral constraints all have an impact on people's intentions and perceptions of control over that conduct. Intentions are then used to guide behavior, according to TPB. Cuong and Jian (2014) investigated how risk psychology, overconfidence, excessive optimism, herd behavior, and other behavioral attitudes affected individual investors' choices in the Vietnamese stock market. The only study that attempted to analyze bitcoin investment intention in line with a recognized behavioral model to predict intentions is the one by Gazali et al. (2019), who used the Theory of Reasoned Action despite its acknowledged flaws and later advances.

Based on the explanation above, the following hypothesis could be generated:

H4: Investors’ attitude toward Cryptocurrency have a significant effect on Investment Intention

III. Research Method

The following table will explain the research methods of this study:

Table 1. Summary of Methods

No	Instruments	Explanation	Notes
1	Research Design	Quantitative, explanatory design	Testing the indicators and hypotheses
2	Data Collection	Primary and secondary data	Online survey, 2 months

3	Population	All investors of cryptocurrency in Indonesia	Unknown in numbers
4	Sampling method	Purposive Sampling on investors of cryptocurrency in Indonesia (especially in Jakarta)	100 crypto investors
5	SEM-PLS Approach	Simultaneously approach	Outer model and inner model
	- Outer Model	Testing loading factor and reliability	17 indicators
	- Inner Model	Testing R-square and hypothesis	4 hypotheses

IV. Findings

4.1. Outer Model

The correlation between the component scores produced using the SmartPLS software will be used to assess the convergent validity of the measurement model with the reflective indicators. The indicator is considered legitimate when the loading factor of a particular indicator factor value is at least 0.5 (Ghozali, 2014). Convergence validity is shown in the Table of Outer Models for weights or loadings. Hence, the AVE and reliability also shown the valid results.

Table 2. AVE and Reliability Results

Variables	Cronbach Alpha	CR	AVE
Perceived Risk	0.674	0.739	0.596
Perceived Knowledge	0.766	0.835	0.680
Perceived Trust	0.785	0.819	0.598
Attitude Toward Behavior	0.851	0.852	0.771
Investment Intention	0.885	0.888	0.814

The outer model is to test the loading factor and the result can be seen below:

Table 3. Outer Model (Loading Factor)

Indicator	Loading Factor	Description
X1.2	0.786	Valid
X2.1	0.811	Valid
X2.2	0.567	Valid
X3.2	0.620	Valid
X5.1	0.894	Valid
X6.1	0.884	Valid
X6.2	0.676	Valid
X7.1	0.676	Valid
X7.2	0.787	Valid
X8.1	0.833	Valid
X8.2	0.789	Valid
X9.1	0.907	Valid
X9.2	0.878	Valid
X9.3	0.848	Valid
X10.1	0.944	Valid
X10.2	0.883	Valid
X10.3	0.878	Valid

4.2. Inner Model

The proposed hypothesis is that "Investors' Perceived Risk of Cryptocurrency have a significant effect on attitudes toward investing in Cryptocurrency." The first hypothesis looks at how the investor's perception of risk influences the investor's attitude toward participating in the crypto market. H1 Original Sample Value was -0.205, T-Statistic is 2.536, and P-Value is 0.011 based on data that have been analyzed using the SEM method. The second hypothesis examines the impact of perceived investor knowledge on investor attitudes toward participating in the cryptocurrency market. The hypothesis is "Investor's Perceived Knowledge of Cryptocurrency Have a Significant Effect on Attitudes Toward Investing in Cryptocurrency."

H2 Original Sample Value was 0.100, T-Statistic is 1.153, and P-Value is 0.249 based on data that have been analyzed using the SEM method.

The third hypothesis looks at the impact of investor perceptions of trust on investor attitudes toward investing in the cryptocurrency market. The hypothesis is that "Investor' Perceived Trust of Cryptocurrency have a significant effect on attitudes toward investing in Cryptocurrency." Based on the data that were analyzed using the SEM method, the P-Value is 0.000, the T-Statistic is 7.492, and the H3 Original Sample Value was 0.566. The last hypothesis looks into the impact of an investor's attitude toward cryptocurrencies on their intention to make an investment; the hypothesis is "Investor's attitude toward Cryptocurrency have a significant effect on Investment Intention." According to data that have been analyzed using the SEM method, the P-Value is 0.000, the T-Statistic is 16.212, and the H4 Original Sample Value was 0.729.

Henceforth, the R-square results can be seen below:

Table 4. R-Square Results

Variables	R-Square
Attitude Toward Behavior	0.498
Investment Intention	0.531

V. Conclusion and Recommendation

The perception of risk was found to have a detrimental and significant impact on investor attitudes toward bitcoin investment. This demonstrates that one of the factors that can affect an investor's attitude is perceived risk. As this study examines potential investors, it comes to the conclusion that risk is a factor that affects whether they want to invest in the cryptocurrency market, particularly because cryptocurrencies are extremely volatile and the trend for cryptocurrencies in 2022 is declining. These factors make potential investors more aware of the risk of investing in cryptocurrencies. Perceived knowledge was found to have no discernible influence on investor attitudes regarding bitcoin investments. The sample size may not be large enough for the variable to be regarded significant, or there may be little variance in the variables because the respondents' levels of perceived knowledge are similar, among other reasons why perceived knowledge is thought to be unimportant. This indicates that investor attitude is more strongly influenced by other factors than perceived knowledge.

The perception of trust has a positive and significant impact on investor attitudes toward bitcoin investments. This demonstrates that a number of factors, including perceived trust, can affect the attitude of investors. Trust is crucial in determining investor attitudes because it affects how likely a potential investor is to invest in cryptocurrencies. The more trust a potential investor has in cryptocurrencies, the more probable it is that they will do so. The intention to invest in cryptocurrencies is positively and significantly impacted by one's attitude toward behavior. Since attitude and goal are strongly related, this variable can be verified. Whether an investor has any intention of making a bitcoin investment depends on their mentality. The most important factor influencing an investor's decision to buy cryptocurrencies is their attitude. Perceived risk, perceived trust, attitude toward behavior, and investor intention all have a substantial correlation, according to this study. This study aims to better understand the factors

that potential investors consider when deciding whether or not to invest in cryptocurrencies so that the company that manufactures such coins, as well as other organizations, the government, etc., can benefit. Based on the findings of this study, the respondent is well aware of the risk associated with investing in the cryptocurrency market and their confidence in cryptocurrencies. The company that produces bitcoin needs to be able to regulate more in regards to the scam that happens. Due to the numerous scams and ponzi that have occurred this year, potential investors' trust has been diminished and they are reluctant to participate in cryptocurrencies, even though all investments are dangerous.

ABSTRACT

Electricity that is for a better life is the tagline of PT PLN (Persero), whilst both oversupply and carbon emission constitute the constraints to emerge it. The oversupply is the deficiency of PT PLN (Persero) to generate energy over than the demand power of customers. Besides, carbon emission influences climate change. This analysis to explore the capability of PLN dived more reasonably to understand the fulfillment of solving oversupply with liquidity ratios to meet business continuity and resiliency. Furthermore, this study aimed to have some inputs for continuous improvement in effective and efficient ways to obtain the growth of financial reports more impactful to save the future either in economy or environment, particularly business sustainability with solvency ratios. The Decree No.KEP-100/MBU/2002 issued by Indonesia Ministry of State-Owned Enterprises in June 2002 provides the mandatory of exploring of the SOE financial health condition. Therefore, the liquidity ratio became a study to analyze the containment among performance, adaptability, and development to obtain revenue with covering profitable orientations to reduce short-term debt using current, quick, and cash ratio. Likewise, fulfilling the long-term debt was imperative to concentrate the business sustainability more simultaneously in risk analysis to have trust from the public that PLN was the only producer of electric energy with eco-friendly. Thus, this study also measured the solvency ratio toward PLN's ability paying off long-term debt, followed by changing the technology of its power plants from high to low-carbon emission and building renewable energy generators to achieve net-zero emission program until 2060.

Keywords: Liquidity Ratio, Solvency Ratio, Continuity, Resiliency, Sustainability

1. INTRODUCTION

Ministry Of Energy And Mineral Resources has an obligation to monitor electricity for human life in Indonesia in which PT PLN (Persero) has the only holder of the electricity distributor. The condition of energy to generate electricity is abundant. The demand of electrical current should be adjusted by the supply from PT PLN (Persero) and it should be balanced between the demand and the supply. In fact, PT PLN (Persero) has had a dilemma between the adjustment of the program and the demand of energy since COVID-19 has ended. As a result, the supply given by PT PLN (Persero) is over compared to the demand from society, business industry, and the government, in which the oversupply is around 7 Gigawatt (Press Release No. 099.PR/STH.00.01/II/2023). Meanwhile, Indonesian population almost feels the circumstance of electrical current in their settlement from urban areas to remote areas according to the ratio of the electrification almost full, reaching to 99,63 percent (<https://www.esdm.go.id/en/media-center/news-archives/2023-indonesia-timur-jadi-target-kejar-rasio-elektifikasi>, 2023). This energy is generated by various power plants, such as fuel-fossil and renewable sources.

The customer of the firm is 82.5 million customers (PLN Statistics in 2021) with a growth of roughly 4 per cent every year, which is around 3 million electric installations. However, government regulation no. 14 of 2012 concerning business activities for the supply of electricity has provided opportunities for the private sector to build power plants and then to sell its energy with PT PLN (Persero) since several years ago, the problem was the funding in Indonesia was low to build new power plants, so the government considered the new regulation, but it did not oppose the constitution. As a result, Indonesia gave chances from the upstream level to investors from local and international. Finally, there was a program of 35,000 Megawatt in May 2015 and the progress was successful to establish the power plants about 415 units with the capacity of 16,596 Megawatt or approximately 47 percent from the program of 35,000 Megawatt.

Nevertheless, the success of the program created oversupply because of the pandemic of COVID-19. Thus, the prediction to forecast the equilibrium is not matched. However, PT PLN (Persero) continuously finds the solutions for the business, so that PT PLN (Persero) prevents loss of the operational cost much and business continuity is expected to result in some breakthroughs. By obtaining the efficiency of about 41 trillion rupiah in 2022, CEO of PT PLN (Persero) reported to Commision VI of The People's Assembly Council of The Indonesia Republic.

Figure 1 : Comparison of PLN's Electricity Supply and Electricity Sold to Customers (2013-2021)

(Source : The Statistics of PLN in 2021)

The red line shows electricity sold to customers while the black line is a supply of electricity produced and purchased by PLN. The gaps between two lines are not narrow, which are from 28,000 – 32,000 Gigawatt. Thus, PLN’s obligation has to accelerate the performance in business continuity to obtain more than the excellent result compared to the common target for key performance indicators to sell the exceeding energy. Additionally, operational cost, investment cost, and production cost as well as short-term debt are illogical to chase the miss of the gap in earning the reasonable revenue. However, the liquidity ratio is the guidance to adjust the business continuity to recover the high difference while pursuing the fast responsiveness.

Moreover, since pandemic has been spreading on earth, all businesses need resiliency to face negative and positive pressure, even WHO urged that every country should apply strict social distancing in the interaction of one another in daily life. As we know, electricity use experienced a downward trend between 2020 and 2022. This was the big challenge that PT PLN (Persero) had. Therefore, measuring the liquidity ratio to solve the catastrophe is imperative to recalculate the right target in the ratio.

Eventually, climate change is currently a global problem that challenges sustainable development around the world. According to the Intergovernmental Panel on Climate Change (IPCC), human activity such as excessive burning of fossil energy and emission of greenhouse gasses is the main cause of climate change. The Paris Agreement exists and is binding on all countries to achieve common goals with ambitious efforts to combat climate change and achieve net zero emissions (NZE). Therefore, the role of all layers in every nation must commit to an agreement for diminishing the carbon emission. This is becoming environmental issues, so it is needed the program of the sustainability. The real contribution from PT PLN (Persero) is becoming the prime obligation to conduct some innovation from high to low carbon emission of the power plants, especially fuel-fossil substances related to sustainability, which affects the environment and social life. Currently, Indonesia has fuel-fossil consumption for power plants more than 50 per cent from the total of power plants in Indonesia, in which the generators produce much carbon emission and contaminate the amount of air.

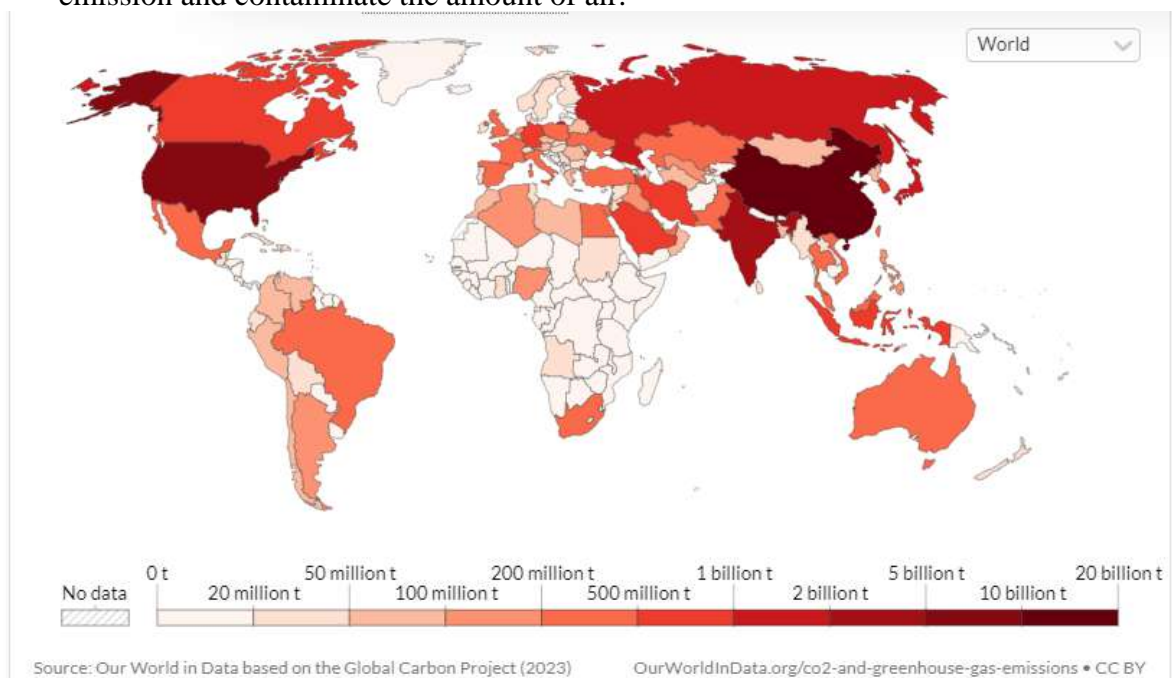

Figure 2 : World Carbon (CO₂) Emissions

(Source : <https://ourworldindata.org/co2/country/indonesia>)

As shown on the map, the total carbon emission in this world is around 37.123 billion tonnes. Meanwhile, there are three countries displaying the darkest red, in which Russia, the USA, and China experience a serious issue of unclean air because of the large amount of the carbon emission, 1.76 billion tonnes, 5.01 billion tonnes, 11.47 billion tonnes respectively. Likewise, Indonesia is the biggest contributor of the emission among southeast asian countries.

Figure 3 : Indonesia Carbon (CO₂) Emissions

(Source : <https://ourworldindata.org/co2/country/indonesia>)

The chart of figure 3 depicts a dramatical increment of carbon emission in Indonesia with the peak point of 659.44 million tonnes in 2019. As observed, the trend is upward. If Indonesia cannot reduce it, the air quality can deteriorate due to climate change. However, alongside 2021, Indonesia was able to eliminate 10.37 million tonnes of carbon dioxide (CO₂) emissions from generators, which is more than double fold of the target of 4.92 million tonnes, but the amount of the emission in Indonesia is not still under 600 million tonnes, with just 619.28 million tonnes. It can be concluded if Indonesia does not conduct breakthroughs above 10 million tonnes of the carbon, so the result of the reduction can be predicted by solely around 370 million tonnes in 2060. The achievement is not optimal to obtain net-zero emission because the increase is not calculated, if there are increases, so the effort has to be tougher. Thus, Indonesia strives to find other solutions more massively to get the significant elimination. All of the contributions need much expenditure to strive the transformation from the high amount of the emission to net-zero. Chief Executive Officer of PT PLN (Persero) said that PT PLN (Persero) needs the budget of 700 Billion Dollar US (<https://www.dunia-energi.com/ini-cara-pln-dapatkan-biaya-us700-miliar-kejar-net-zero-emissions-2060/>,2022). If the enterprise borrowed the money for a debt, the effect is not significant to the financial report. It can even subtract the liquidity ratio and add the time period of the solvency ratio. A negative influence of debt

ratio on Return of Asset (ROA) for a sample of companies from Hong Kong, Singapore, South Korea, and Taiwan. However, Akenga (2017), Kebewar and Shah (2012), and Baum et al. (2006) found that debt has no significant impact on profitability. Hence, it is better to allocate the profit as retained earnings to invest in the breakthrough of carbon emission reductions on power plants through controlling liquidity ratio strictly to keep business continuity and resiliency to face uncertainty from technological disruption.

That is why PT PLN (Persero) takes the obligation to concern the imperative role to boost its performance in clean productions, but the result can cover diminishing the carbon and yielding the revenue to earn profit and cash flow more reasonably to support business continuity in short-term performance and debt at the same time. All of the processes need some funds to create new innovations to filter the carbon from the cycle of the electric energy production. Hence, exploring solvency ratio is the right tool to keep the healthy finances and control on the track according to the roadmap in achieving efficient results with effective ways, such as investing in renewable energy power plants and creating the innovative tools to eliminate the carbon dioxide emission.

To conclude, the conditions of PT PLN (Persero) about an imbalanced calculation are such as oversupply with the high gap, power plants with high carbon emission that impact climate change, lack of funds to support the low carbon emission power plants, unstable and unplanned business continuity, resiliency, and sustainability. Last but not least, the alternatives that can be taken to overcome the imbalances are, particularly, exploring the liquidity ratio fulfills business continuity, and resiliency to minimize the high gap of the oversupply, followed by exploring the solvency ratio fulfills business sustainability to obtain the low carbon emission and renewable power plants.

Profile of PT PLN (Persero)

The national power utility of Indonesia is PT Perusahaan Listrik Negara (Persero) ("PLN"). With more than 80.7 million subscribers as of June 2021, PLN is one of the biggest electric utility providers in the world. The mission of PLN, a fully government-owned business and the second-largest state enterprise in terms of assets in Indonesia, is to support national development by ensuring a consistent supply of energy over the entire nation. In Indonesia, PLN is the only entity that purchases, transmits, and distributes power, with the exception of a few industrial parks and off-grid locations. As of June 2021, PLN's power supply was made up of a combination of its own production, which as of that date totaled 45,855 Megawatt, and purchases from IPPs, which as of that date totaled 17,293 Megawatt.

The quality of PLN's energy mix for the production of electricity is being improved significantly. By building new generating plants based on cutting-edge and renewable energy sources, PLN aims to lessen the environmental effect of its power generating facilities. According to a government regulation, the Ministry of Energy and Mineral Resources is directing PLN to attain carbon neutrality by 2060 and a mix of new and renewable energy sources of 23% by 2025.

In 2020, PLN will create 13.1% of its new and renewable energy from self-owned plants, leased facilities, and IPPs. According to RUPTL predictions, PLN will need to have 19.9 Gigawatt worth of new and renewable energy generating facilities by 2025 in order to reach its desired mix. The overall capacity of PLN's new and renewable energy generation was 7.9 Gigawatt at year's end 2020, hence the company has to construct an additional 12.0 Gigawatt of new and renewable energy generation capacity. Geothermal,

wind, solar, hydro, and biomass-powered energy generating facilities can be used as an alternative to new, sustainable energy-generating facilities.

By analysing the issues, the researchers consider that the study is to conduct some academic approaches in financial tools to measure the imbalanced measurement among various situations and conditions followed by the alternatives to fix the case of imbalances in line with the human imagination and the logical calculation. Therefore, firstly, we need to conduct the research for liquidity ratio in the short-term period from 2018 to 2022. Secondly, conducting the analysis of solvency ratio is to predict the capability of PT PLN (Persero) to cover operational and investment cost for funding the net zero emission (NZE) until 2060 because in the future, PT PLN (Persero) faces volatility, uncertainty, complexity, ambiguity, and disruption in digital era, particularly digitizing business and finance process to adapt a variety of dynamic changes globally from generating stage to distributing stage, so the performance and the development to tackle the challenges have to be controlled with noticing the solvency ratio in long-term period.

2. LITERATURE REVIEW

a. Liquidity Ratio

The first literature is based on Joe Lan (2012). Liquidity ratios are the ratio to measure a firm's ability to meet its short-term obligation. The metric helps determine if a company can use its current, or liquid, assets to cover its current liabilities. Three liquidity ratios are commonly used – the current ratio, quick ratio, and cash ratio.

A ratio of 1 means that a company can exactly pay off all its current liabilities with its current assets. A ratio of less than 1 (e.g., 0.75) would imply that a company is not able to satisfy its current liabilities. A ratio greater than 1 (e.g., 2.0) would imply that a company is able to satisfy its current bills. In fact, a ratio of 2.0 means that a company can cover its current liabilities two times over. A ratio of 3.0 would mean they could cover its current liabilities three times over, and so forth.

Types of Liquidity Ratios

1. Current Ratio

The current ratio is the simplest liquidity ratio to calculate and interpret. Anyone can easily find the current assets and current liabilities line items on a company's balance sheet. Divide current assets by current liabilities, and you will arrive at the current ratio.

2. Quick Ratio

The quick ratio is a stricter test of liquidity than the current ratio. Both are similar in the sense that current assets is the numerator, and current liabilities is the denominator.

However, the quick ratio only considers certain current assets. It considers more liquid assets such as cash, accounts receivables, and marketable securities. It leaves out current assets such as inventory and prepaid expenses because the two are less liquid. So, the quick ratio is more of a true test of a company's ability to cover its short-term obligations.

3. Cash Ratio

The cash ratio takes the test of liquidity even further. This ratio only considers a company's most liquid assets – cash and marketable securities. They are the assets that are most readily available to a company to pay short-term obligations.

b. Solvency Ratio

Based on Joe Lan (2012), solvency ratios measure a company's ability to meet its long-term obligations. The metric is very useful to lenders, potential investors, suppliers, and any other entity that would like to do business with a particular company. It usually compares the entity's profitability with its obligations to determine whether it is financially sound. In that regard, a higher or strong solvency ratio is preferred, as it is an indicator of financial strength. On the other hand, a low ratio exposes potential financial hurdles in the future.

Limitation of the Solvency Ratio

Although the solvency ratio is a useful measure, there is one area where it falls short. It does not factor in a company's ability to acquire new funding sources in the long term, such as funds from stock or bonds. For such a reason, it should be used alongside other types of analysis to provide a comprehensive overview of a business' solvency.

Other Solvency Ratios

Financial ratios enable us to draw meaningful comparisons regarding an organization's long-term debt as it relates to its equity and assets. The use of ratios allows interested parties to assess the stability of the company's capital structure. Here are a few more ratios used to evaluate an organization's capability to repay debts in the future.

1. Debt-to-Equity (D/E) Ratio

Often abbreviated as D/E, the debt-to-equity ratio establishes a company's total debts relative to its equity. To calculate the ratio, first, get the sum of its debts. Divide the outcome by the company's total equity. This is used to measure the degree to which a company is using debt to fund operations (leverage).

2. Interest Coverage Ratio

With the interest coverage ratio, we can determine the number of times that a company's profits can be used to pay interest charges on its debts. To calculate the figure, divide the company's profits (before subtracting any interests and taxes) by its interest payments. The higher the value, the more solvent the company. In other words, it means the day-to-day operations are yielding enough profit to meet its interest payments.

3. Debt-to-Capital Ratio

As implied in the name, the debt-to-capital ratio determines the proportion of a business' total capital that is financed using debt. For example, if a company's debt-to-capital ratio is 0.45, it means 45% of its capital comes from debt. In such a case, a lower ratio is preferred, as it implies that the company can pay for capital without relying so much on debt.

c. Business Continuity and Business Resiliency

Disruptive events are a nearly inevitable consequence of operating in a complex environment, and being properly prepared is key to an efficient restoration of normal business operations.

Many leaders may be operating under the illusion that the Central Administration will provide a complete backstop for any deficiencies experienced, such as technical expertise, system availability, human resources, and budget

assistance. However, the responsibility for planning for a significant interruption and preparing how to resume normal business activities, especially the financial consequences of such, falls to department leadership, who can, and should, be engaging with Central Administration in its planning process.

A basic question department heads should ask themselves to self-assess its business resiliency preparedness:

Financial and liquidity

- Are there financial protocols to provide crisis funding, protect liquidity, and maintain the business?
- Have you defined the broad scope of root-cause investigations and how they will be governed?

d. Business Sustainability

In business, sustainability refers to doing business without negatively impacting the environment, community, or society as a whole.

Sustainability in business generally addresses two main categories:

- The effect business has on the environment
- The effect business has on society

The goal of a sustainable business strategy is to make a positive impact on at least one of those areas. When companies fail to assume responsibility, the opposite can happen, leading to issues like environmental degradation, inequality, and social injustice.

Sustainable businesses consider a wide array of environmental, economic, and social factors when making business decisions. These organizations monitor the impact of its operations to ensure that short-term profits don't turn into long-term liabilities.

Examples of Sustainability in Business

Many successful organizations participate in sustainable business practices, however, no two strategies are exactly the same.

Sustainable business strategies are unique to each organization as they tie into larger business goals and organizational values. For instance, sustainability in business can mean:

1. Using sustainable materials in the manufacturing process
2. Optimizing supply chains to reduce greenhouse gas emissions
3. Relying on renewable energy sources to power facilities
4. Sponsoring education funds for youth in the local community

3. RESEARCH DESIGN AND METHODOLOGY

The research design of financial performance analysis of PT PLN (Persero) was developed using a liquidity ratio analysis and a solvency ratio analysis which comes from the audited financial report of the company from 2018 to 2022. The research design and variable of this study are illustrated in **Figure 4**.

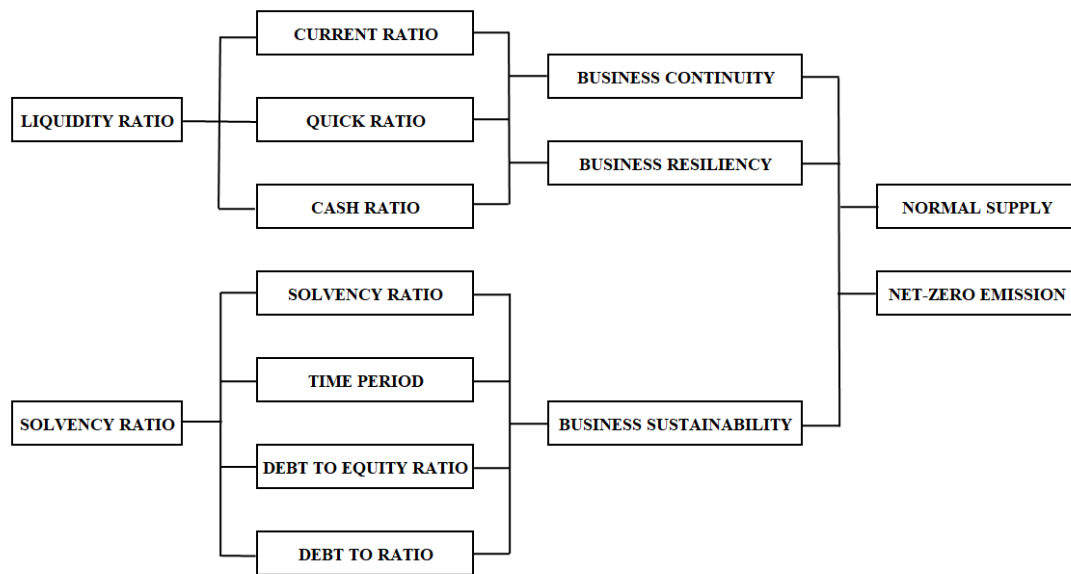

Figure 4 : Financial Performance Analysis

Research Hypotheses

- H0₁ : Using Current Ratio, there is a fluctuated trend in financial performance From 2018 To 2022
- H0₂ : Using Quick Ratio, there is a fluctuated trend in financial performance From 2018 To 2022
- H0₃ : Using Cash Ratio, there is a fluctuated trend in the financial performance From 2018 To 2022
- H0₄ : Using Solvency Ratio, there is a fluctuated trend in financial performance From 2018 To 2022
- H0₅ : Using Time Period, there is a fluctuated trend in the financial performance From 2018 To 2022
- H0₆ : Using Debt to Equity Ratio, there is a fluctuated trend in financial performance From 2018 To 2022
- H0₇ : Using Debt to Ratio, there is a fluctuated trend in the financial performance From 2018 To 2022

A. Location and Time of Research

By exploring the inputs of audited financial reports from 2018 to 2022, the authors obtained data of PT PLN (Persero), for two months from March to May 2023.

B. Data Collection Methods

The steps to collect the information related to research were gained as follow:

1. the website of PT PLN (Persero) is <https://www.pln.co.id>
2. field studies namely direct observation investigated objects.
3. observation, namely how to collect information through direct observation of the object under investigation.
4. direct conversations with company management and employees relating to writing this thesis

C. Types and Sources of Data

1. Data type

- a) Quantitative data consists of data in the form of numerical report about the company
- b) Qualitative data in the form of data intended by the parties company directly in the form of financial reports etc.

2. Informants

- a) Primary data, namely data that received directly performance driven company observations and interviews with managers and employees, such as a brief overview, organizational structure and business.
- b) Secondary data, namely data that is received from company documents either in the form of reports writing is complete periodically, such as financial reports.

D. Method of Analysis

By achieving the outputs of the research, the analytical method is used as follows:

1. Analysis of the liquidity ratio with the following formula
 - a. Current Ratio

$$\text{Current Ratio} = \text{Current Assets} / \text{Current Liabilities}$$
 - b. Quick Ratio

$$\text{Quick Ratio} = (\text{Cash} + \text{Accounts Receivables} + \text{Marketable Securities}) / \text{Current Liabilities}$$
 - c. Cash Ratio

$$\text{Cash Ratio} = (\text{Cash} + \text{Marketable Securities}) / \text{Current Liabilities}$$
2. Analysis of the solvency ratio with the following formula
 - a. Solvency Ratio

$$\text{Solvency Ratio} = (\text{Net Income} + \text{Depreciation}) / \text{All Liabilities (Short-term} + \text{Long-term Liabilities)}$$
 - b. Time Period

$$\text{Time Period} = 100 \% / \text{Solvency Ratio}$$
 - c. Debt to Equity Ratio

$$\text{Debt to Equity Ratio} = \text{Total of Liabilities} / \text{Equity}$$
 - d. Debt to Ratio

$$\text{Debt to Ratio} = \text{Total of Liabilities} / \text{Total of Asset}$$

4. RESULT AND DISCUSSION

Table 4.1 Current Ratio (CR) Calculation Result

Year	Current Asset	Current Liabilities	Current Ratio (%)
2018	113,415,251	157,895,954	0.72
2019	151,366,673	159,298,153	0.95
2020	97,153,318	149,629,528	0.65
2021	85,911,375	146,538,480	0.59
2022	119,391,382	145,071,451	0.82

(Source : Audited Financial Report Of PT PLN (Persero) 2018-2022 and Lumban Gaol, 2023)

Before the pandemic of COVID-19, PT PLN (Persero) from the table showed a growth to almost 1. This means that the enterprise was able to fulfill the current activities without many hesitations. If there were a matter of COVID-19 among 2020-2022, the position of the ratio could reach a peak of above 1. However, uncertainty could be solved by the enterprise alongside

the pandemic although the ratio decreased almost one-third, which was the lowest ratio of 0,59 and the same time the burden for power plants because of the last program of 35,000 Megawatt was finished that was the liabilities so high, such as account payable, and obligation as the majority of more than half of the total of current liabilities. Finally, in 2022, the movement shifted to grow up at 0,82, displaying a recovery trend. As a matter of fact, the trend was not the worst, but consequently, many operational and investment activities had to be more efficient than the ordinary period. Moreover, oversupply happened throughout the five-year timeline. Therefore, after the health issue, PT PLN (Persero) has to prepare many breakthroughs to fix the condition so that the business process is stable, continuous, and resilient to cover the fast responsiveness to the public in order to absorb the oversupply energy, and make the better development in current ratio. Thus, at least, PT PLN (Persero) has to have an addition of current ratio about 0.3 to protect the uncertainty for three years because of the pandemic of COVID-19.

Table 4.2 Quick Ratio (CR) Calculation Result

Year	Current Asset	Stock	Current Liabilities	in million rupiah
				Quick Ratio (%)
2018	113,415,251	15,506,567	157,895,954	0.62
2019	151,366,673	12,934,233	159,298,153	0.87
2020	97,153,318	10,277,289	149,629,528	0.58
2021	85,911,375	10,393,419	146,538,480	0.52
2022	119,391,382	17,534,804	145,071,451	0.70

(Source : Audited Financial Report Of PT PLN (Persero) 2018-2022 and Lumban Gaol, 2023)

The table showcases that alongside the timespan, the quick ratio was not able to pay off the current liabilities. This could not avoid the account payable due to oversupply, and the obligation. Besides, the stock was just having a range of 0.085-0.12. from the current asset. In the meantime, the cash was from 35 percent to 50 percent of the current asset. This was the condition of the low demand during the social distancing, so many activities especially office operated its operational process through work from home. It was major not only for governmental but also private sectors following the regulation, so the revenue was earned insufficiently to prevent the gap because there was no crisis fund based on the fundamental of business continuity and resiliency (<https://rmas.fad.harvard.edu/business-continuity-and-business-resiliency>, 2023) at least two years, but it is better to allocate more than three years. This proved that the enterprise did not fulfill the foundation of the business orientation. However, the amount of carbon emission for two years experienced a downward trend.

Table 4.3 Cash Ratio (CR) Calculation Result

Year	Cash – Cash Equivalent	Current Liabilities	in million rupiah
			Cash Ratio (%)
2018	33,294,560	157,895,954	0.21
2019	46,598,783	159,298,153	0.29
2020	54,735,434	149,629,528	0.37
2021	37,968,399	146,538,480	0.26
2022	51,503,096	145,071,451	0.36

(Source : Audited Financial Report Of PT PLN (Persero) 2018-2022 and Lumban Gaol, 2023)

In 2018 to 2020, PT. PLN (Persero) still uses manual cash not in the form of petty cash or petty cash and the cash pattern is still not exceeded, so the system is still declining. In 2021 until now PT. PLN (Persero) is preparing ERP-SAP to use the PPFA (Centralized Management and Administration Function) system to extend the SAP with more functions. The PPFA system will separate administrative functions in the areas of finance, human resources and general affairs. Starting in 2021 until now, each PLN in the Unit can drop from the PLN Distribution office an amount of rupiah for petty cash and within one week the petty cash must have zero balance, otherwise the money will be withdrawn (swap). With the PPFA system there will be efficiency in internal PLN operational costs. However, the process was not yet covering all of the offices. Additionally, the system is still built to operate extensively step by step for the function of the third parties in order to pay the result after accomplishing their contracts, all administrations and to prevent fraud from the long bureaucracy to the system of financial SAP at the head office. Cash can be gained fast because the process of billing management, such as the electric bills to customers can be processed online and realtime. This system was integrated and embedded among Centralized Customer Service Application (AP2T), Flow Management and Monitoring Centralized Revenue (P2APST) and System Application and Product in Data Processing (SAP) (<https://journal.eng.unila.ac.id/index.php/jitet/article/download/2439/1186>, 2022).

Table 4.4 Solvency Ratio (CR) Calculation Result

in million rupiah				
Year	Profit	Depreciation	Total Liabilities	Solvency Ratio (%)
2018	11,575,756	157,895,954	565,073,888	7.49
2019	4,322,130	159,298,153	655,674,600	6.05
2020	5,993,428	149,629,528	649,247,189	7.31
2021	13,174,877	146,538,480	631,609,333	8.65
2022	14,414,720	145,071,451	646,688,710	9.04

(Source : Audited Financial Report Of PT PLN (Persero) 2018-2022 and Lumban Gaol, 2023)

The business process gained revenue more much than the operational cost, so PT PL (Persero) earned profit. It is not only increasing the revenue but also the firm significantly optimized the efficiency in the right priority because the negativity of the low power demand between 2019 and 2020 was so dramatical. Meanwhile, the target was low depreciation and optimizing the increasing debt. Lastly, in 2022 the corporation showed the better performance than the prior periods. However, all leaders should oversee the control of long-term debt since business can be affected by sustainability risks becoming the constraint of ecosystem-friendly.

Table 4.5 Time Period Calculation Result

in million rupiah

Year	Profit	Depreciation	Total Liabilities	Solvency Ratio (%)	Time Period (Year)
2018	11,575,756	157,895,954	565,073,888	7.49	13.35
2019	4,322,130	159,298,153	655,674,600	6.05	16.54
2020	5,993,428	149,629,528	649,247,189	7.31	13.69
2021	13,174,877	146,538,480	631,609,333	8.65	11.56
2022	14,414,720	145,071,451	646,688,710	9.04	11.06

(Source : Audited Financial Report Of PT PLN (Persero) 2018-2022 and Lumban Gaol, 2023)

If PT PLN (Persero) can allocate its profit for the right calculation to be retained earnings from right now to 2060. the company will fulfill the obligation of Net-Zero Emission. Because if the corporation took some debts, the company just increased the interest as a burden. Even though the margin experienced an upward trend, the firm has to consider the future in sustainability of NZE. It is better for PT PLN (Persero) to increase the long-term debt not to invest the asset with the high depreciation, especially an obsolete technology of power plants. Besides, the spare part will be discontinued several years later and there is no substitution to change its materials. Therefore, PT PLN (Persero) should establish power plants sourcing renewable energy, in which the location is not far from company's medium voltage networks and substations. The consideration is particularly efficiency and business sustainability to reach the population of customers and to connect the economic growth of societies. Thus, the funding to cover business sustainability has many requirements to notice long-term debt to be reduced without adding the same debt because the right strategy according to the previous research is to hold retained earning to allocate paying-off the obligation more effective to monitor the ratio.

Table 4.6 Debt to Equity Ratio Calculation Result

Year	Equity	Total Liabilities	Debt to Equity Ratio (%)
2018	927,413,857	565,073,888	60.93
2019	929,380,413	655,674,600	70.55
2020	939,812,592	649,247,189	69.08
2021	981,607,123	631,609,333	64.34
2022	991,450,566	646,688,710	65.23

(Source : Audited Financial Report Of PT PLN (Persero) 2018-2022 and Lumban Gaol, 2023)

The ratio showed a fluctuation of the equity, and the liability seemed an identical trend in 2019, so it could be predicted the equity used for OPEX (operational cost) inefficiently during the pandemic of COVID-19 where the company operated oversupply and the energy consumption was declining markedly.

Table 4.7 Debt to Ratio Calculation Result

Year	Total Asset	Total Liabilities	Debt to Ratio (%)
2018	1,492,487,745	565,073,888	37.86
2019	1,585,055,013	655,674,600	41.37
2020	1,588,914,720	649,247,189	40.86
2021	1,613,216,456	631,609,333	39.15
2022	1,638,139,276	646,688,710	39.48

(Source : Audited Financial Report Of PT PLN (Persero) 2018-2022 and Lumban Gaol, 2023)

The ratio gave the opportunity to fulfill the sustainability goal of optimizing the investment using the low cost technology with orienting to the zero or low carbon emission. It is getting much better assets by changing the technology to lower carbon emission. In the meantime, the total carbon emissions that were successfully reduced through cofiring at the 33 PLTUs amounted to 391 thousand tons of CO₂ for a semester (<https://web.pln.co.id/cms/media/2022/10/tekan-emisi-karbon-pln-hasilkan-listrik-hijau-394-gwh-dari-cofiring-33-pltu/>, 2022). Thus, the result was positive to yield a low carbon emission, and eco-friendly surrounding the power plants with the sustainable comprehension, but the target was not optimum yet.

5. CONCLUSION AND RECOMMENDATION

a. Conclusion

Although PT PLN (Persero) has been improving its performance in the enterprise system of finance, the process is still under constructed to support a central payment system of the third parties, particularly the procurement of goods and services in the contracts. This is to accelerate the business to pursue continuity, resiliency, and sustainability with business associates fulfilling the obligation of PT PLN (Persero), such as reducing the amount of carbon emission on power plants.

b. Recommendation

PT PLN (Persero) should have a crisis fund to protect liquidity ratio, particularly to allocate retained earnings to cover Net-Zero Emission, business continuity, resiliency, and sustainability every single period rather than to borrow debt in which it is only increasing the number of liabilities, so that recovering the oversupply to be normal.

ABSTRACT

Indonesia's oil and gas industry is the huge contributor to government export revenues and contributes a substantial amount to state revenue. However, the total oil production dramatic declined around 17% in year 2019, and the sharpest decline was in 2020. This situation gives impact to performance of oil and gas industry, especially government revenues. Therefore, the purpose of this study is to measure the financial performance of Oil and Gas Industry. The data were collected from financial report during 2017-2021. Paired sample t-test and financial ratio analysis (FRA) were used to analyzed the data. The finding shows that the largest oil and gas company in Indonesia is still in good financial condition, although it gained loss. In addition, current ratio and return on equity had significance in oil and gas production. The authors believe that findings will be helpful for management who continuously attempt to explore opportunities to provide a higher return.

Keywords: Financial Performance; Oil Price, Solvency; Profitability, SEOs.

INTRODUCTION

In recent years, oil and gas industry has become the vital part of the economics of Indonesia and Global market. This industry gives huge contribution in many ways, including investment, job creation, regional growth, and oil export revenue, taxation, and energy security. It even played a huge role in human life. For examples, petroleum can be used to make plastic, water bottle, and roads. It can keep our engine run smoothly and gas can be used to cook food. In the case of oil price, Oil and Gas industry has experienced dramatic volatility, both Indonesia and Globally (1-5) supported that the oil price has been volatile since its first oil crisis in 1973. According to PWC in year 2016, the amount of oil price in the global market declined sharply from US\$145 per barrel in the mid of 2008 to approximately US\$40 per barrel at the end of 2008. Then oil price was an increase at US\$ 77,11 per barrels in 2010 and a further increased at US\$91,39 per barrels in 2011 as per Energy today in year 2015. However, the amount of oil price fell slightly at US\$88,95 per barrels in 2012 and a further fell at US\$ 49,93 per barrels in May 2016. On the other hand, the oil price in Indonesia is not in line with the changes of oil price in global. In 2008, the amount of oil price was lower than the crude oil price in global which is US\$96,13 per barrels and then it fell down to US\$61,58 per barrels in 2009 as reported by Indonesia Crude Price in year 2009. Next, there was a significant increase at US\$ 79,4 per barrels in 2010 and a further increased to US\$112,73 per barrels. However, it falls down to US\$ 49,46 per barrels in 2016 as explained by Ministry of Energy and Mineral Resources of Republic of Indonesia in year 2016. And in 2021 the oil price become US\$73,36 per barrels. The volatility of oil price has been affected by the limited production and high demand.

Fig. 1: Crude Oil Price Movement

Figure 1 gives information about the crude oil price movement Indonesia between 2017 to 2021. Overall, the oil price fluctuated. The highest amount of oil price was in December 2021. The lowest oil price is from January-December 2020.

Source: SKK Migas Annual Report 2021

Fig. 2: Performance of crude oil and gas

Figure 2 gives information about the performance of crude oil and gas production Indonesia between 1966 and 2020. Overall, the amount of oil and gas production fluctuated. The highest amount of oil and gas production was in 1977 and 2020 respectively. The lowest amount of oil and gas production is from 2013 to 2014 and 2018-2020. In crude oil production, there was a sharp increase from just over 400 MBOEPD in 1966 to approximately 1677 MBOEPD in 1977, and then it declined dramatically to 825 MBOEPD production, it increased dramatically from approximately 70 MBOEPD in 1966 to just over 800 MBOEPD in 2011, however, it decreased to 1225 MMSCFD and in from 2018 to 2020 still decreased. In other meaning, Oil production in Indonesia has experienced a sharp decline about 3-5% per year. In addition to that, Oil and Gas industry still remains the main sources of state revenue, although the volatility of oil price gives a huge impact to the economy sectors. According to Frecka & Lee (6), firms should measure the financial ratio and adjust the performance based on industry norms. Most studies on financial performance have focused on bank, retail and manufacturing, hospital, construction and SME industry (7-10).

The present study is focusing on oil and gas industry. It is covering one of the biggest Oil and Gas Company in Indonesia in the period 2020 – 2021. The purpose of this study is to measure the level of financial performance of Oil and Gas industry in Indonesia using financial ratio analysis and to examine the differences between the performance of oil and gas in the period of before and after the decline in crude oil and gas production. The outcome of this study will facilitate the student and academicians to assess the financial performance of the company and to make learning more practical and understood. This study also will be beneficial for

6th International CEO Communication, Economics, Organization & Social Sciences Congress

management to evaluate the performance of their company before making decisions. This study is organized into seven sections. Section one captures the introduction, section two highlight the performance of Indonesia's oil and gas industry, section three highlight the literature review about previous researchers, section four discuss the methodology, section five discuss the finding and analysis, section six highlights the implication and section seven captures the conclusion

1. DEVELOPMENT OF OIL AND GAS IINDUSTRY IN INDONESIA

In Indonesia, the existence of Oil and Gas industry has begun since 1871 or more than 130 years ago with their first oil production in 1885 in North Sumatera. After the independence in 1950, the government of Republic Indonesia began to inventory the sources of state income which include the business from oil and gas. But then, there were conflicts between one company and other company who competing to control these fields. It looked unmanageable and filled with conflict. In 1957, PT PERMINA restructured into PN PERMINA and established PERTAMINA. It followed the government policy that the party entitled to conduct oil and gas exploration in Indonesia is the government. In 1962, Indonesia joined The Organization of the Petroleum Exporting Countries (OPEC) with Iran, Iraq, Kuwait, Saudi Arabia, Venezuela, Qatar, Libya, United Arab Emirates, Algeria, Nigeria, Ecuador, Angola, and Gabon as explained on OPEC website, in year 2016. This collaboration has helped them to establish a good research, develop the organization's international standing, and set good and fair prices for petroleum producers. To strengthen the operation of this company, the government issued Law No. 8 in 1971, where it set the role of PERTAMINA as the only stateowned company who implement and exploit the oil and gas. It began from manage and produce oil and gas from the oil fields in the whole of Indonesia, processed into various products and provide the needs of fuel oil & gas throughout Indonesia. In 2001, Government implements the Act No. 22/2001. After the implementation, the position of Pertamina is equal with other oil companies. On 17 September 2003, PERTAMINA changed into PT PERTAMINA (Persero) under PP 31/2003. The Act, among others, also requires the separation between the oil and gas business activities in the downstream and upstream. Furthermore, on July 20, 2006, PT PERTAMINA launched a program about the transformation of the company with two major themes namely fundamental and businesses. To further solidify the transformation program, on December 10, 2007, PT PERTAMINA changed the company's vision became, "To be a World Class National Oil Company". Responding to the prevailing global development, PERTAMINA is seeking to expand the field of oil and gas efforts toward the development of new and renewable energy. However, Indonesia began to import oil in 2004 due to lower oil production and high demand of consumption. Indonesia suspended its membership in 2008 due to oil and financial crisis. After seven years of absence, Indonesia decided to return to OPEC in 2015. However Indonesia finally decided to leave OPEC again at the end of November 2016 with reason was OPEC's decision to cut production quotas in order to improve oil price.

Table 1: Key Indicator.

Indicator	2016	2017	2018	2019	2020	2021

ESDM

Base on www.worldometers.info/gas/indonesia-natural-gas According Indonesia is on top 13th of world's oil producers with total reserve around 98 trillion cubic feet (Tcf) in 2017, and according to Investing News Network (11), Indonesia is on top 22 of world's oil producers with the total reserve around 49,74 trillion cubic feet (Tcf) in 2021. Based on table 1, the number of crude oil production decreased from 801,02 millions barrels of oil equivalents in 2017 to 658,54 millions barrels of oil equivalents in 2021, while the number of natural gas decrease from 1,347 thousand cubic feet in 2017 to 1,178 thousand cubic feet in 2021.

Table 2 : Oil & Gas Revenue

Description	2017			2018			2019			2020			2021		
	APBN	Actual	%	APBN	Actual	%	APBN	Actual	%	APBN	Actual	%	APBN	Actual	%
Oil	57,410	58,200	58,20	59,800	101,500	170,30	118,800	83,800	70,50	40,400	44,900	111,10	57,900	85,000	112,20
Natural Gas	11,800	23,840	159,72	20,800	41,300	198,90	41,200	37,500	91,00	12,900	24,200	187,80	17,100	31,800	185,30
Oil & Gas Revenue	72,210	81,840	113,34	80,400	142,800	177,700	159,800	121,100	75,40	53,300	69,100	129,60	75,000	96,600	128,80

Source: Kemenkeu Data 2021

Based on table 2, Oil & Gas revenue has been out of target APBN, while the oil and gas revenue and the percentage of contribution have fluctuated between 2017 to 2021. In 2019, oil & gas revenue was under the target APBN. Those amounts decreased dramatically. However, there was a sharp increased of oil and gas revenue in 2021.

2. PREVIOUS RESEARCH ON FINANCIAL PERFORMANCE

According to Charliepaul et al. (12), the financial ratio is a good evaluation method to measure the company performances. The company usually uses this method to compare their performance with other competitors. There are two methods to measure the financial performances which are accounting and market measurement. There are many researchers who prefer to use accounting measurement (13, 14), rather than market measurement (15, 16), and some of them adopt both methods (17). There are few differences between accounting and market measurement method. In accounting, the company uses the historical aspects to measure their financial performance (18) and it contains a bias which leads to managerial manipulation. On the other hand, the market measurement method is straight forward, focus on performance and represent the ability of a company to generate future income (17).

There have been a large number of empirical studies on the financial ratio in different industries around the world (19, 20). However, there are limited resources which evaluate the financial performance of Oil and Gas Company in Indonesia. According to Tarawneh (20), the financial ratio analysis (FRA) has been applied in Banking industry to examine, evaluate, and ranked based on their performance. Based on the study in Oman Commercial Banks, financial performance has a relationship with asset management, size, and operational efficiency. (21) investigated the financial performance in four major Oil and Gas Company and found that three of them have a high level of satisfactory and Exxon Mobil was the outstanding one. According to (22), there is significance different in the performance of oil and gas industry in Indonesia between ROA, ROE, current ratio, and quick ratio in the period of before and after the global crisis.

3. RESEARCH MODEL

Based on figure 2, this research model adapted from the previous study by (22). It describes the process of measuring financial performance and examines the differences between the performance of oil and gas industry before and after the decline in oil and gas production. It expands the knowledge with more practical experience.

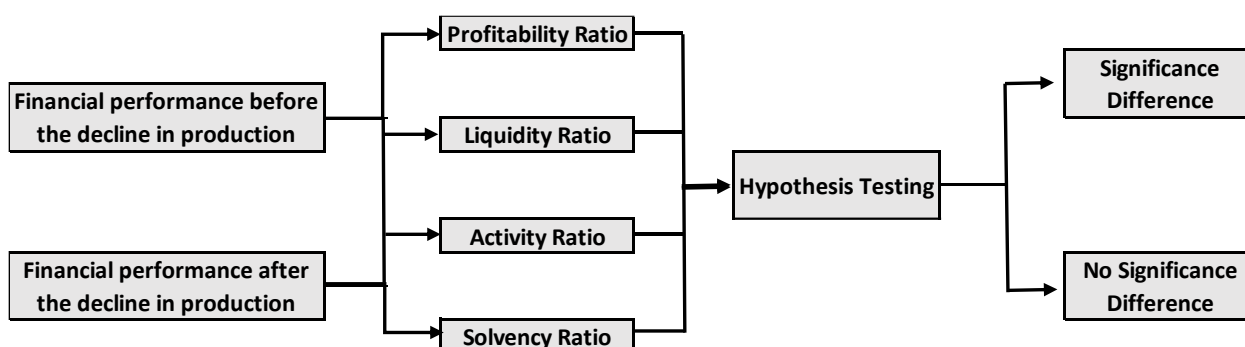

Fig 2 : Research Model

4. HYPOTHESIS

- ✓ P1: Using return on equity ratio, there is a significance difference in financial 2017 to 2021 the decline in oil and gas production.
- ✓ P2: Using return on investment ratio, there is a significance difference in financial performance 2017 and 2021 the decline in oil and gas production.
- ✓ P3: Using cash ratio, there is a significance difference in financial performance 2017 and 2021 in oil and gas production.
- ✓ P4: Using current ratio, there is a significance difference in financial performance 2017 and 2021 the decline in oil and gas production.
- ✓ P5: Using collection period ratio, there is a significance difference in financial performance 2017 and 2021 the decline in oil and gas production.
- ✓ P6: Using total asset turnover, there is a significance difference in financial performance 2017 and 2021 the decline in oil and gas production.
- ✓ P7: Using a Liability to equity ratio, there is a significance difference in financial performance 2017 and 2021 the decline in oil and gas production.
- ✓ P8: Using a Liability to asset ratio, there is significance in financial performance difference 2017 and 2021 the decline in oil and gas production.

5. METHODOLOGY

To accomplish this study, descriptive financial ratio analysis used to measure, describe and analyze the financial performance of Oil and Gas Company in Indonesia during the period of 2020 – 2021. Statitcal technique to use in 2020 and 2021 studies and use to compare two population means. It has been used many times in the previous study in workers' productivity, medical, business, and much more (23, 24). PT PERTAMINA was selected because it is the first oil and gas company in Indonesia with their extensive experience in the industry. In this research, data were collected from Annual Report (audited) from 2020 to 2021. The variables are shown in table 2. It consists of profitability ratio, liquidity ratio, activity ratio, and solvency ratio.

6. RESEARCH AND AND DISCUSSION

6.1. Profitability Performance

The line chart below gives information about the percentage of return on equity (ROE) and return on investment (ROI) in PT PERTAMINA between 2017 and 2021 (Table 3). Overall, the percentage of ROI increased sharply in 2018 and decreased in 2019 and 2020 and there was a sharp increase in 2021 the percentage of ROE. Between 2017 and 2021, the percentage of ROI was increased significant from 23% to 27%. Even thought in 2019 and 2020 the ROI was decreased. It is caused by the increase of oil prices (Table 4). (Pertamina Annual Report in year 2017-2021).

Table 3: Oil & Gas Revenue

PERTAMINA EP	2017	2018	2019	2020	2021
Return On Equity (ROE)	18%	22%	19%	6%	21%
Return On Investment (ROI)	23%	30%	28%	17%	27%

Source : Kementrian ESDM 2017- 2021

Fig 3: Profitability Trend

6.2. Liquidity Performance

The graph below shows the percentage of cash ratio and a current ratio of PT. PERTAMINA from 2017 to 2021. Overall, there was a dramatic decrease in the percentage of cash ratio and current ratio. The current ratio is the general indicator to measure the liquidity of the company. In the horizontal analysis, the average current ratio for the past five years was 162% (Table 5) which means that Rp 1.620,- of current liability were to be guaranteed by Rp 1.620 of a current asset. Between 2017 and 2021, the percentage of current ratio dramatic decreased from 149% to 71%. In cash ratio, the percentage decreased from 37% in 2017 to 7% in 2021. The average of cash ratio for the last five years was 27.2% (Table 5). It indicates that the number of current liabilities was guaranteed by cash. PT. PERTAMINA can optimally manage its working capital within safe limits. So, it does not have short-term financial problems or the company in a liquid condition.

Fig 4: Liquidity Trend

Table 5: 5 Years Liquidity

Liquidity (%)	2021	2020	2019	2018	2017
Cash Ratio	7%	26%	33%	33%	37%
Current Ratio	71%	149%	221%	209%	160%

6.3. Activity Performance

The line chart below gives information about the percentage of inventory turnover and total assets turnover and the number of collection period from PT. PERTAMINA between 2017 and 2021. Overall, there was a slight decrease in the number of those two ratios. In total assets turnover (TATO) was remained same from 44% in 2017 to 44% in 2021. In collection period (CP), the number increased slightly from 22 days in 2017 to 37 days in 2021. We can conclude that those two ratios were in good condition after pandemic and the management of assets ran efficiently.

Fig 5: Activity Trend

Table 6: 5 Years Activity

Efficiency	2021	2020	2019	2018	2017
CP (day)	37	18	22	21	22
TATO (%)	44%	34%	46%	50%	44%

Source : Pertamina EP 2017-2021 annual report

6.4. Solvency Performance

The graph below shows the percentage of Liability to equity ratio (LTER) between 2017 and 2021. Overall, there was a dramatic increase from 87% in 2017 to 170% in 2021. And Liability to asset ratio (LTAR) Between 2017 and 2021, the percentage increased slightly from 46% to 63%. In the long term, PT. PERTAMINA rated insolvent because the average ratio of Liability to equity ratio for the last 5 years was only 105%, and the average ratio of Liability to asset ratio for the last 5 years was only 50% where the general standard was 50%. It shows that the risks of the company were in standard.

Fig 6: Solvency Trend

Table 7: 5 Years Solvency Trend

Solvency	2017	2018	2019	2020	2021
LTER	87%	77%	82%	107%	170%
LTAR	46%	44%	45%	52%	63%

Source : Pertamina EP 2021 annual report

6.5. Hypothesis Testing

Table 8 gives information about the result from paired sample test. Overall, five hypothesis are accepted and two hypothesis are rejected. The result found that current ratio has statistically significance difference between 2017 and 2021 in oil and gas production with the 160% and 71%, and then return on equity (ROE) also has statistically significance difference with 18% and 21% In other words, it has strong evidence that the decline in oil and gas production affect the changes in financial performance (Fig:7). It is in line with the study conducted by Purwanegara et al., (22). In addition, the value of Liability to equity ratio, Liability to asset ratio are under the standard (70%). Therefore, we reject the hypothesis.

Indicator	2017	2018	2019	2020	2021
Production					
Crude Oil (MBOPD)***	801,02	772,13	145,14	708,32	658,54
Natural Gas (MMSCFD)***	1,347	1,372	1,279	1,180	1,178

Fig 7: Pertamina EP Production 2017-2021

Table 8: The Variables

1. Profitability Ratio	
Return on Equity	Return on Equity = (Net Income/Shareholders Equity) x 100%
	ROE indicates the bank's profitability and growth potential
Return on Investment	Return on Investment = (total revenue - total cost/total cost) x 100%
	ROI show the ability of the company to measure the income generated on investment relative to the amount of money invested
2. Liquidity Ratio	
Cash Ratio	Cash Ratio = (cash + cash equivalents/current liabilities) x 100%
	Cash Ratio measures the liquidity of the company to pay the current liabilities with cash and equivalents. If cash ratio above 1, it means that company has the ability to pay its current liabilities. If cash ratio below 1, it means company needs more than cash and equivalents to pay it.
Current Ratio	Current Ratio = (current asset/current liabilities) x 100%
	The Current Ratio measures the company ability to pay its short-term and long-term liabilities using their short-term assets.
3. Activity Ratio	
Total Asset Turn Over	Total Asset Turn Over = (Revenue/Capital Employed) x 100%
	TATO ratio indicates the company ability to generate revenue from deploying its asset. A higher ratio indicates that company is using its asset more efficiently and low ratio indicates that company is using its asset deficiently.
4. Solvency Ratio	
Laibilities to Equity Ratio	LTER = (total debt/total shareholder equity) x 100%
	LTER ratio indicates if higher debt-equity ratio indicates a levered firm, which is quite preferable for a company that is stable with significant cash flow generation, but not preferable when a company is in decline
Laibilities to Equity Ratio	LTAR = (total liabilities/total asset) x 100%
	LTER ratio indicates if high liabilities to assets ratio can be negative; this indicates the shareholder equity is low and potential solvency issues. Rapidly expanding companies often have higher liabilities to assets ratio (quick expansion of debt and assets).

Tabel 9: Ratio Data

	Period	Means	Standard	Decision
ROE	2020	6%	8,32%	Accept the hypotesis
	2021	21%		
ROI	2020	17%	5%	Accept the hypotesis
	2021	27%		
Cash Ratio	2020	26%	1%	Accept the hypotesis
	2021	7%		
Current Ratio	2020	149%	3%	Accept the hypotesis
	2021	71%		
CP	2020	18 days		Rejected the hypotesis
	2021	37 days	30	
TATO	2020	34%		Rejected the hypotesis
	2021	44%	>50%	
LTER	2020	107%	100%	Accept the hypotesis
	2021	170%		
LTAR	2020	52%	70%	Accept the hypotesis
	2021	63%		

7. LIMITATION

This study has expanded the literature about financial performance in the real working world. In near future, it is suggested to carry out research with many companies from oil and gas industry to get more generalizes result. Since the focus is on one industry, it is worth to explore it on a wider scale and find out if different company yields the same result. In addition, the study only focuses on financial aspects. It is suggested to measure the financial performance of SEOs in other aspects such as operational and administration.

8. CONCLUSION AND RECOMMENDATION

The purpose of this research is to measure the financial performance of Oil and Gas Company in Indonesia and to examine the significance differences between financial performance the decline in oil and gas production (2017 – 2021). The research found that the financial performance of PT. PERTAMINA for five years period is good, although there was a decline in the production. In addition, five ratios have different significance such as ROE, ROI, Cash ratio, current ratio and Liability to equity ratio in the period 2017-2021 the decline in oil and gas production. Manager in Oil and Gas Company should consider these factors when analyzing the strategy and decision. This research also found that other ratios have insignificant differences on financial performance in the period 2017-2021 in oil and gas production in Indonesia. They are Collection period, Total asset Turnover and Liability to asset ratio. This research has extent the knowledge in the theory of financial ratio analysis from oil and gas industry. This is also beneficial for the academicians and student to understand the financial ratio and help them to apply it into real working life. In addition, this study gives huge contribution for managers before investor making a decision.

ABSTRACT

The covid-19 pandemic has caused a major impact on the life of society and the country as well. The second year of mutualism with the Covid-19 pandemic is uneasy. However, it had brought Alfamart, a retail store under PT. Sumber Alfaria Trijaya to be tough. In this term, tough is defined as being strong in dealing with any occurring changes and circumstances and also being tough in optimizing all resources to deliver the best for our stakeholders with the aim of still making a profit. In order to manage the expectation of stakeholders to get profit and sustainability of the business, the company must have health checked on their finances. By Measuring the financial condition could identify indications of financial problems and could avoid the possibility of Bankruptcy. To avoid Bankruptcy, research has been conducted to analyze the financial health of the company using the Altman Z-Score method model for PT Sumber Alfaria Trijaya Tbk on the periods of 2019 – 2021. The result of the analysis Altman Z-Score will result from the level of the company's financial health as follows A Z-score above 2,99 indicates the financials of a company is in healthy condition. A Z-Score Scores between 1,88 to 2,29 indicates that financial health is in the grey area and most likely to be in a critical period. A Z-score below 1,8 indicates that the financial health business has a high potentiality of bankruptcy.

Keywords: Financial Health, Bankruptcy, Altman Z-Score, Retail Industry, Alfamart

INTRODUCTION

In Asia, the Indonesian retail industry sector has experienced fast expansion and now accounts for about 13% of the nation's GDP. Indonesia has considerable potential for the Asian retail market due to its comparatively large population of more than 270 million, its expanding middle class with greater purchasing power, and the millennial generation with larger spending habits and more contemporary spending habits. Retail and Trade Statista, 2022. Local competitors dominate the extremely fragmented Indonesian retail market. And one of the leaders in the retail convenience store market, Alfamart under PT. Sumber Alfaria Trijaya Tbk. has continued to grow after dealing with dynamics condition in the last few years supported by the commitment and resilience of all personnel, the Company managed to record a positive performance of 12% growth in 2021 (Annual Report, 2021). However, during the Outbreak of Covid – 19, as stated by Tomin Widian, PT Sumber Alfaria Triajaya Tbk. Sales increased by 4.17% driven by the increase in revenue from the company outlets and the growth of outlets, while the net income decreased by 1.82% (Kurniawan H, 2020). *Bisnis.com* (2021) also confirmed that during Covid-19 Alfamart has increased stores from 14,430 in 2019 to 15.434 in 2020. Apart from the prominence of physical retail channels, online marketplaces have successfully penetrated the country's retail market over the last decade.

In addition to the fact that Indonesian consumers are now more aware and frugal with their purchasing because of the current inflation, consumer spending behavior is still recovering from the effects of the Covid-19 outbreak. It demonstrates that Covid-19 caused a large decline in Indonesia's retail sales index between March 2020 and March 2021. In Indonesia, a short-term indicator of the value of items sold by retail businesses is created using the retail sales index. (Nurhayati, 2023). The downtrend of the retail sales index impacts some big retailers to have a risk of going bankrupt in early 2021. Going on Bankruptcy is a legal proceeding initiated when a business is unable to repay outstanding debts and offers a fresh start to provide relief and release a company from most debt (Touville, 2021). What was quite phenomenal The Giant Hypermarket declared to close down all the Giants outlets in July 2021 as a company strategy to adapt and respond to changes in market dynamics due to the shifting behavior of Indonesian consumers and businesses no longer delivering profitability. The financial performance had been inferior since 2019.

Multiple variables in the modern retail trade contributed to the issue of business failure. The Covid-19 pandemic has altered the retail industry's distribution channel structure in Indonesia. Following the imposition of social distance restrictions, online shopping penetration increased, which led to a decline in the revenues of physical distribution channels. (Nurhayati, 2023), Consumer traffic in retail outlets is declining as a result of fierce rivalry among retailers and the development of start-ups. A major contributor to business failure is the improper consideration of financial health conditions or the lack of study of financial performance and annual reports, which increases the risk of choosing the incorrect course of action when determining future financial projections.

It is important to establish the right solution to foresee the same issue occurring in the future business by learning from the issues and causes that increased the retail company's risk of bankruptcy. The Altman Z-Score approach should be used to analyze the state of financial health, according to the author, as the best course of action. By understanding the company's financial health over the years, the author used this research to analyze and measure the financial performance of PT Sumber Alfaria Trijaya Tbk, one of Indonesia's top modern

retailers, from 2019 to 2021. The goal was to assess the probability that the company would file for bankruptcy.

LITERATURE REVIEW

1. Retail Business Industry

Retail company can be defined as the practice of selling daily items or services to meet consumer wants, generate value for their client, and capture market value, according to Sopiah & Sangadji (2021) a retail firm that primarily sells goods made by others and a retail business that interacts directly with end customers are two distinctive features of the retail business model (Sorescu A. et al, 2021)

There are also several types of retailers. A department store sells a wide range variant of merchandise, Grocery Store and Supermarket are selling all types of F&B products and other home appliances products, Warehouse Retailer sells in Bulk a large variety of products packaged and in large quantities, Specialty / Outlet Retailers specialize in exclusive and brand name products, Convenience Retailer usually sells a limited range of grocery merchandise and auto care products, Discount Retailer sells often private labeled or generic brands, Online Retailer selling directly thru e-commerce website for a lower price than retail. In this case, PT Sumber Alfaria Trijaya is categorized as Grocery Store (Farfan, 2020).

2. Financial Statements and Annual Reports

Daryanto, et al (2021) stated financial statements serve a crucial purpose in business. It gives internal and external stakeholders important details about the company's financial situation and performance throughout the years. A financial statement is regarded as being a part of financial reporting by Pernyataan Standard Akuntansi Keuangan (PSAK). A report that demonstrates the accountability of the resources entrusted to management is included in the financial statement, which details what management has accomplished. A balance sheet, an income statement, a statement of cash flow, a statement of changes in equity, and financial statement notes make up a comprehensive financial statement. The Management makes decisions based on financial statements. The business was also able to compare the performance gap by using the analysis from the financial report for each year. The comparison is necessary to assess the company's financial performance improvement strategy and policy.

3. Bankruptcy

According to Achmada (2019) bankruptcy or financial distress is a condition where the company's finances are in an unhealthy state or in crisis. The level of health is very important for companies to increase efficiency in running company operations in order to obtain increased profits so as to avoid bankruptcy. It is also concluded that bankruptcy is the inability of a company to meet obligations or debts. This inability arises when there are bad signals that can be recognized early by looking at financial statements which are then carefully analyzed with certain methods (Supriyanto & Darmawan, 2018). Financial Ratios can be used as an earlier indication of a company's bankruptcy from the company financial statement. Earlier prediction is crucial for the shareholder and management to determine the right strategy to find the best solution for the company and stakeholders.

4. Altman Z-Score Method

Altman Z-Score method (Altman, 1968) is the analysis that uses multiple discriminant analysis or MDA by utilizing a comprehensive list of financial ratios from a financial statement in order

to predict the possibility of bankruptcy. One of the most successful Multiple Discriminant Analysis models during the past 40 years of research is Altman's Z-score model. Altman's Model has been used in various industries to predict bankruptcy. Researchers have utilized Altman's Z score model to predict whether businesses will have a downfall in the service industry, manufacturing industry, publicly traded enterprises, and banks. Different authors have employed all three revisions of the Altman equation in their studies, with constructive predictability. It can be safely said that Altman's Z score Model can be applied to the modern economy to predict distress and bankruptcy one, two & three years in advance. (Anjum, 2012). Hayes et al (2010) analyzed the construction of Z-Score model by applying it to a sample of 17 US firms from the retail industry, the study revealed that the model correctly predicts bankruptcy at a level of 94%.

The formula for Altman Z-Score :

$$Z=1.2 X1+1.4 X2+3.3 X3+0.6 X4+1.0 X5$$

Whereas:

- X1 = Working Capital to Total Assets
- X2 = Retained Earnings to Total Assets
- X3 = Earnings Before Interest and Tax to Total Assets
- X4 = Market Value of Equity to Total Liabilities
- X5 = Sales to Total Assets
- Z = Overall Index

If Z value is greater than 2.99 the company is classified as a healthy company, If Z is below 1.81 the company will bankrupt. While the Z is between 1.81 and 2.99 the company will be defined as a “zone of ignorance” or “grey area”.

METHODOLOGY

The methodology used in this research is quantitative and the data used in this research are adapted from the Annual Report of PT Sumber Alfaria Trijaya Tbk from the year 2019 to 2021. This research is conducted to see and predict if PT Sumber Alfaria Trijaya Tbk is having financial distress. However, the ratio used in the bankruptcy analysis are:

1. Working Capital to Total Asset (X₁)

This ratio demonstrates the company's ability to generate net working capital from all its total assets. This ratio is calculated by dividing net working capital by total assets. Net working capital is obtained by reducing current assets by current liabilities. Negative net working capital is likely to have difficulty covering short-term liabilities due to not having enough current assets to cover these liabilities. However, businesses with positive net working capital have few problems paying their financial obligations

$$X_1 = \frac{\text{Net Working Capital}}{\text{Total Assets}}$$

2. Retained Earnings to Total Assets (X₂)

This ratio measures the cumulative profit against the age of the company which shows the strength of income. This ratio demonstrates the company's capacity to generate retained earnings from all of its assets. Profits that are not distributed to shareholders

are referred to as retained earnings. In other words, retained earnings reflect the portion of a company's revenue that is not distributed to shareholders in the form of dividends.

$$X_2 = \frac{\text{Retained Earnings}}{\text{Total Assets}}$$

3. Earnings Before Interest and Tax to Total Asset (X₃)

This ratio shows the company's ability to generate profit from the company's assets, before interest payments and tax.

$$X_3 = \frac{\text{EBIT}}{\text{Total Assets}}$$

4. Market Value of Equity to Total Liabilities (X₄)

This ratio demonstrate the company's ability to satisfy obligations and liabilities from the market value of its capital (common stock). The market value of equity itself is obtained by multiplying the number of common shares outstanding by the value per share of common shares. The value of debt is obtained by adding current liabilities to long-run liabilities.

$$X_4 = \frac{\text{Market Value of Equity}}{\text{Book Value of Debt}}$$

5. Sales to Total Assets (X₅)

This ratio demonstrate whether the company generated sufficient business volume relative to its investment in total assets. This ratio reflects the efficiency of management using the company's total assets to drive sales and make a profit.

$$X_5 = \frac{\text{Sales}}{\text{Total Assets}}$$

RESULT AND DISCUSSION

Ratio Analysis

6. Working Capital to Total Asset (X₁)

The data shown in the table below represent (X₁) or the working capital to total assets of PT Sumber Alfaria Trijaya Tbk from the year 2019 to 2021.

**Table 1 - Working Capital to Total Asset
PT Sumber Alfaria Trijaya Tbk 2019 - 2021 (in million Rupiah)**

Item	2019	2020	2021
Current Asset	14.782.817	13.558.536	14.211.903
Current Liabilities	13.167.601	15.326.139	16.376.061
Working Capital	1.615.216	(1.767.603)	(2.164.158)
Total Assets	23.992.313	25.970.743	27.493.748
Value of (X ₁)	0.067	-0.068	-0.078

To calculate working capital to total asset, we must know the value of Working Capital, that is ‘Current Asset - Current Liabilities’. Table 1 shows that there is a continuously decreasing trend of the value of (X_1) in 2020 and 2021 compared to the value of (X_1) in 2019.

The decreased of (X_1) value indicates that PT Sumber Alfaria Trijaya Tbk has more value of current liabilities compared to their current assets, which is not showing a good trend during the pandemic Covid-19.

7. Retained Earnings to Total Assets (X_2)

Table 2 shows the data of retained earnings to total assets of Sumber Alfaria Trijaya Tbk from the year 2019 to 2021.

**Table 2 - Retained Earnings to Total Asset
PT Sumber Alfaria Trijaya Tbk 2019 - 2021 (in million Rupiah)**

Item	2019	2020	2021
Retained Earnings	4.168.800	4.423.085	5.986.898
Total Asset	23.992.313	25.970.743	27.493.748
Value of (X_2)	0.173	0.170	0.217

From the table above, we see that there is a slightly improvement of the value of (X_2) from the year 2019-2020 to 2021. This indicates that PT Sumber Alfaria Trijaya Tbk generates retained earnings steadily during the pandemic Covid-19.

8. Earnings Before Interest and Tax to Total Assets (X_3)

Table 3 shows the data of earnings before interest and tax (EBIT) to total assets of PT Sumber Alfaria Trijaya Tbk from the year 2019 to 2021.

**Table 3 - Earning Before Interest and Tax to Total Asset
PT Sumber Alfaria Trijaya Tbk 2019 - 2021 (in million Rupiah)**

Item	2019	2020	2021
EBIT	1.851.754	1.770.647	2.790.895
Total Asset	23.992.313	25.970.743	27.493.748
Value of (X_3)	0.07	0.06	0.10

There is an incremental in (X_3) value of 0.04% in 2021 and it keeps steady in 2019-2020. This indicates that PT Sumber Alfaria Trijaya Tbk has an increase in profit income from the year 2021 but remains constant in 2019 and 2020.

9. Market Value of Equity to Total Liabilities (X₄)

Table 4 shows the data of the market value of equity to total liabilities of PT Sumber Alfaria Trijaya Tbk from the year 2019 to 2021.

**Table 4 - Market Value of Equity to Total Liabilities
PT Sumber Alfaria Trijaya Tbk 2019 - 2021 (in million Rupiah)**

Item	2019	2020	2021
Market Value of Equity	6.696.944	7.442.104	8.790.746
Total Liabilities	17.108.006	18.334.415	18.503.950
Value of (X₄)	0.39	0.40	0.47

Table 4 shows that the Value of (X₄) increased steadily from 2019 to 2021. This indicates that PT Sumber Alfaria Trijaya Tbk has lower liabilities compared to their income.

10. Sales to Total Assets (X₅)

Table 5 shows the data of sales to total asset of PT Sumber Alfaria Trijaya Tbk from the year 2019 to 2021.

**Table 5 - Sales to Total Asset
PT Sumber Alfaria Trijaya Tbk 2019 - 2021 (in million Rupiah)**

Item	2019	2020	2021
Sales	84.903.301	75.826.880	72.944.988
Total Asset	23.992.313	25.970.743	27.493.748
Value of (X₅)	3.54	2.92	2.65

The table above shows a constant decrease and of the value of (X₅) in the year of 2019 to 2021, which indicates that sales in PT Sumber Alfaria Trijaya Tbk has not been good.

11. Z-Score Analysis

Table 6 shows the data of Z-Score of PT Sumber Alfaria Trijaya Tbk from the year 2019 to 2021.

**Table 6 - Z-Score Formula
PT Sumber Alfaria Trijaya Tbk 2019 - 2021 (in million Rupiah)**

Item	2019	2020	2021
X1	0.08	-0.08	-.009
X2	0.24	0.24	0.30

X3	0.23	0.20	0.33
X4	0.23	0.24	0.28
X5	3.54	2.92	2.65
Z-Score	4.33	3.51	3.47

Table 6 shows the Z-Score throughout the past three years from 2019 to 2020, The Z- Score value of 2019 is 4.33 which shows above the range of the healthy score, It should conclude that PT Sumber Alfaria Trijaya Tbk is delivering a great performance and financial health before and during the pandemic Covid-19. However, The score is showing a slight downtrend from 4.33 in 2019 to 3.47 in 2021. So, it is confirmed that for PT Sumber Alfaria Trijaya Tbk no data show of going on bankruptcy. PT Sumber Alfamart Trijaya is in healthy financial performance facing the challenging situation.

Conclusion and Recommendation

1. Conclusion

- a. This research is done to analyze the financial health and the possibility of PT Sumber Alfaria Trijaya Tbk to go into bankruptcy, followed are the result:
 - i. Working capital to total assets shows a significant decrease from 2019 to 2021, this indicates that PT Sumber Alfria Trijaya Tbk has a greater value of current liabilities compared to the current assets, which is not showing a good trend during the pandemic Covid-19.
 - ii. Retained earnings to a total asset have remained steady in 2019-2020, although they rose in 2021.
 - iii. EBIT to total assets of PT Sumber Alfria Trijaya Tbk has slightly decreased in the year 2020, but it gets better in the year 2021. This indicates that there is significant profit-making yet did not have loss either.
 - iv. The market value of equity to total liabilities of PT Sumber Alfria Trijaya Tbk slightly increased in 2020 - 2021 compared to 2019. It also indicated that the liabilities are also increased, it might be PT Sumber Alfaria Triaaja having a new project as a contingency plan to anticipate the situation during a pandemic.
 - v. Sales to total assets also show a decreasing trend, as Sumber Alfria Trijaya Tbk did not sell as much.
 - vi. Financial performance of PT Sumber Alfria Trijaya Tbk 2019-2021 period, seen from the ratios using the Altman Z Score method, produced a Z-Score Index value of 4.33 in 2019 and 2020 the Z-Score index value decreased to 3.51. Followed by 2021 the Z-Score index value decreased slightly from the previous year to 3.47.
 - vii. Based on the classification of the Z-Score index value developed by Edward Altman in predicting the potential for bankruptcy at PT Sumber Alfria Trijaya Tbk for the 2019-2021 period, the results of the 2019 Z-Score Index are in the Altman Z-Score position of 4.33 $Z\text{-Score} > 2.99$ so that it is in a healthy zone position, Followed in 2020-2021 it is still in the position of the healthy zone because the result of the Altman Z-Score calculation is still above 2.99.
 - viii. The Z-Score shows that PT Sumber Alfria Trijaya Tbk is not facing financial difficulties during the pandemic Covid-19.

2. Recommendation

PT Sumber Alfria Trijaya Tbk is indicated to be in the healthy financial performance area category of Z-Score, which means that PT Sumber Alfria Trijaya Tbk has experienced a strong financial health performance, especially in 2019. Even though The Z-Score shows there is a slightly decrease from year to year in 2020-2021, it never got worse due to the fluctuation of sales revenue and current liabilities, The incremental in EBIT that makes the company survive.

We suggest that PT Sumber Alfria Trijaya Tbk should be managed carefully in running some new projects and on the operational costs as well, as we figure out in the financial report there are greater liabilities, compared to the income. PT Sumber Alfria Trijaya Tbk is able to survive from the challenging situation that others might suffer losses. We certainly affirm that PT Sumber Alfria Trijaya Tbk would be able to perform better performance and profitability for their stakeholder.

ABSTRACT

The Covid-19 pandemic brought forces that disrupted the supply chain of the global economy. Coal as one of the main commodities in the energy-producing electricity sector has also been affected by the global lockdown and supply chain disruptions. This major phenomenon occurs globally for at least three full years, from 2020 to 2022, coal prices fluctuate significantly due to scarcity in all global markets. Indonesia as one of the largest coal producers takes advantage of this market shift. On the Indonesia Stock Exchange there are 29 listed coal mining companies, these companies have different health conditions based on their financial performance. This paper examines the development of the financial health of PT Indo Tambangraya Megah Tbk. (ITMG stock symbol/code on IDX), one of the coal mining companies listed on the Indonesia Stock Exchange, during the pre-pandemic - pandemic - increase in coal prices and the aftermath of the pandemic, from fiscal year 2018 to 2022, using the financial distress analysis model Altman Z-score. This study aims to determine the condition of ITMG's financial health amidst the current condition of coal price volatility. The study finds that there is strong recovery in coal market after covid-19 pandemic that was beneficial for the firm, thus this information can be used as input and consideration for stakeholders to make decisions.

Keywords: Altman Z-Score, Coal, Coal Miner, Financial Distress

INTRODUCTION

Global energy market sees coal as one of the most competitive sources of energy, among other fossil fuels, coal's cost competitiveness increases until the late of 2020s until 2030s, the demand comes from mainly emerging economies (BP, 2022). Southeast Asia region contributes to the most of emerging economic growth rate and coal has been the main source of energy creation in Southeast Asia. In 2047 the effective capacity of operating coal-powered power plants in Southeast Asia will reach 54.000 Mega Watt with the major top contributors are Indonesia, Vietnam, Malaysia, and Philippines, the typical coal power plant have 30-40 years lifespan (Clark et al., 2020).

Indonesia is one of the largest coal suppliers and producers, particularly thermal coal. BP Statistical Review of World Energy stated that Indonesia currently ranked 9th in terms of world coal reserves, accounting for about 2.2% of total global coal reserves. For about 60% of its total coal reserves consist of low quality thermal sub-bituminous coal. Roughly 70-80% of its coal production is exported all around the world, with China, Japan, India and South Korea being the main buyers. Indonesian coal exports generate around 3 billion USD monthly and contributing to the country's GDP record exports in 2021. Indonesian mining industry mainly focused on Kalimantan and Sumatra Islands (Kurniawan & Managi, 2018).

Indonesia remains the biggest coal producers in Southeast Asia, the history came from 1980s, a sector boom in Indonesia's coal mining industry is happened in 1980s after sub sequence law revision in mining regulation. The boom of rapid development made Indonesia the world's largest steam coal supplier later the year, managing 38% global coal exports in 2013 and supplying one half of SEA and Asia demand for coal (Friederich & van Leeuwen, 2017). Moreover, Indonesia's coal industry supplies high demand domestic market, the main purpose is for electricity generation (Ordonez et al., 2022). However, the industry faced challenging period of lower export demand and lower prices, resulting in lower profitability and demotivating new exploration activities.

The coal mining industry continue to expand in Indonesia, in 2023, there are at least 29 listed public companies in IDX coal mining sector. PT Indo Tambangraya Megah Tbk was founded in 1987, the firm main business was in coal mining and trading activities. The company has approximately 87,560 hectares in mining service contracts and produces thermal coal with low dust and sulfur content PT Indo Tambangraya Megah Tbk operates several major coal mines in Indonesia, specifically in the provinces of East Kalimantan, Central Kalimantan, and South Kalimantan. The company also had a coal terminal in Bontang, the coal products are used in coal-fired power plants in domestic and international markets such as China, North Asia, and India (PT Indo Tambangraya Megah Tbk, 2023). The company made its initial public offering in Indonesia Stock Exchange on 18 December 2007, with the share price of Rp 14.000. Since then the stock was actively traded in the main board of IDX and was included in LQ 45 Index of highly liquid stock. The purpose of the research is to assess the financial condition of the market during the pandemic, the period of assessment is limited to 5 years period from 2018 to 2022, Altman bankruptcy prediction model is applied to the analysis to see whether the firm is experiencing financial distress during those period of time.

1. LITERATURE REVIEW

1.1 Coal Mining

The mining activities has been occurred from hundred years, the extracting activities from beneath the earth surface resulting in varieties of earth resources commodities, one of the commodities is coal. Coal mining can be classified into two types: surface (opencast mining), and underground (deep mining). These are two of the common methods of coal mining. The choice of mining method is determined from the stand point of geological characteristics of the prospectus mine, the location of the coal seams, and the tools-equipment available at the time the mine is to start operation. Currently, most of the coal is mined using one or several underground methods to get access to the coal source. However, with the introduction of larger and more sophisticated machines, surface mining is way more preferred method for productivity and safety. (Osborne, 2013).

1.2 Financial Statements and Annual Reports

Annual report is a report that produced annually by a corporation to all of its stockholders that contains financial statements and the management analysis of current condition of the firm based on past performance and future expectation (Brigham & Houston, 2019). There are two major aspects on an annual report, the verbal aspect that underlines the letter from the firm's management, it exposes past performance and new developing future operations. The second aspect is four basic form of financial statements, the first is the balance sheet, the second is income statement, the third is the statement of cash flow and the last, statement of stockholders' equity. Annual report of a public companies are readily available mostly on their respecting website, this was because the public can become stockholders of the firm (Mastuti et al., 2012).

Financial Statements main purpose is to provide an accounting state of the firm's operation condition and the financial position. All the four statements linked to each other and must be taken together to give clearer picture of the firm's financial position. (Brigham & Houston, 2019). All the financial statements provided by the firm must undergo an audit by accredited auditors before it published to the public, to ensure transparency and maintain it's integrity.

Financial statement analysis is conducted to acquire the particular data that is needed in the company's financial health assessment. The differences between past years and current year numbers can be analyzed and compared, this will result in a change of company policy and strategy. Ratios also play significant role in financial statement analysis, the financial ratios can be used to describe particular condition that have been developing in the firm.

1.3 Distressed Firm

There are four generic terms associated with distressed firm, failure, insolvency, default and bankruptcy, these terms had slight distinct meaning. Failure means the realized return on investment adjusted with risk allowance is lower compared to common investments, failure also describe a lower average return on investment compared to firm's cost of capital. Insolvency is generally used in more technical ways, it is a condition when a firm is unable to pay its debt or liability that come overdue, this indicates the weakness of cash flow or lack of liquidity. Insolvency can be temporary or if it is serious enough will make the firm out of

business. Default is a condition when borrower violates agreement with the creditors, that the firm missed required interest or principal payment in a determined window of period. When the period is end, the firm is in default and often can lead to bankruptcy filing. Bankrupt is a term often used to firm when its obligations exceed the governing value of its assets.

(Altman, Edward I Hotchkiss, Edith Wang, 2019).

1.4 Altman Z-Score

Distress prediction model was created by Edward I. Altman in 1967 as an empirical formula to predict the outcome of bankruptcy of a distressed firm. Altman's Z-Score is a model that predicts the likelihood and the probability of a company going bankrupt in the next two years by calculating several financial ratios and entering them into a discriminant equation. Developed by Edward Altman in 1968, this model combines five financial ratios to predict the probability of a company becoming insolvent in the near future. The Z-Score is determined by standard calculations that indicate the likelihood of a company going bankrupt, and it uses profitability, leverage, liquidity, solvency, and activity to predict whether a company has a high probability of bankruptcy. Altman figured five financial ratios that can be fused together to see the difference between bankrupt and non-bankrupt companies. The formula for calculating Altman's Z-Score includes five weighted metrics: Working Capital to Total Asset, Retained Earnings to Total Asset, Earnings Before Interest and Taxes (EBIT) to Total Assets, Market Value Equity to Book Value of Total Debt(liabilities), and Sales to Total Asset (Altman, edward I Hotchkiss, Edith Wang, 2019).

$$Z_i = 1.2X_1 + 1.4X_2 + 3.3X_3 + 0.6X_4 + 1.0X_5$$

with:

X_1 = Working Capital divided by Total Assets

X_2 = Retained Earnings divided by Total Assets

X_3 = Earnings Before Interest and Tax divided by Total Assets

X_4 = Market Value of Equity divided by Total Liabilities

X_5 = Sales divided by Total Assets

Z_i = Altman Z-Score

Z-score predictive model describes a healthy financial condition when above 2,99 or in a safe zone from bankruptcy, gray area is the zone between Z-score from 1,88 up to 2.99, this zone concludes the company is neither healthy or in distress, the gray area have higher chance if bankrupt compared to the safe zone. Z-score below 1,88 indicates that the firm is in high probability of going into bankruptcy. This predictive model is widely used and tested based on empirical methodology.

In 1995, the Z-score predictive model was revised to a more universal version called Z"-score, Altman's Z"-Score model was developed in 1995 for all industrial, manufacturing, and non-manufacturing companies. It's first application on Mexican companies and Latin American firms. This model later was successfully applied in the US and also suitable to any other company, the accuracy is better compared to the original Z-Score model. The Z"-Score model is also suitable to private firms because X_4 uses book equity to total liabilities, not market

values. This substitution is required for environments with low confidence level that sees the stock market is not good enough to do valuation measure. The fifth variable, Sales to Total Assets, is unused because X5 variable was sensitive to industrial sector differences and with countries that capital investment was lacking. This version of the predictive models used Discriminant Analysis so constant term of (3.25) is added.

$$Z''i = 3.25 + 6.56X_1 + 3.26X_2 + 6.72X_3 + 1.05X_4$$

with:

X_1 = Working Capital divided by Total Assets

X_2 = Retained Earnings divided by Total Assets

X_3 = Earnings Before Interest and Tax divided by Total Assets

X_4 = Book Value of Equity divided by Total Liabilities

$Z''i$ = modified Z-Score

The modified model of Z''-score had different range of zone, provided with the credit rating, the modified Z''-score is a more comprehensive version of the model. Numbers of study using Altman Z-score to assess the firm's financial condition is done in various Indonesian companies (Brazer & Daryanto, 2019; Daryanto & Silitonga, 2020; Sugeng & Daryanto, 2021)

Table-1: Z'' score rating and classification

Zone	EM Score	Rating	Zone	EM Score	Rating	
Safe zone	8,15	>8,15	Grey zone	5,65	5,85	BBB-
	7,6	8,15		5,25	5,65	BB+
	7,3	7,6		4,95	5,25	BB
	7	7,3		4,75	4,95	BB-
	6,85	7		4,5	4,75	B+
	6,65	6,85		4,15	4,5	B
	6,4	6,65		3,75	4,15	B-
	6,25	6,4		3,2	3,75	CCC+
	5,85	6,25		2,5	3,2	CCC
				<1,75	2,5	CCC-
		<1,75	1,75	D

2. METHODOLOGY

The research use descriptive type of research as the methodology. Descriptive research is the type of research with purpose to identify and explain the nature and characteristic of the variables being studied in a given situation.. Quantitative research analysis is also used to calculated the data, the data was secondary data collected from the firm's Annual Report of PT

Indo Tambangraya Megah Tbk from year 2018 to 2022. The calculation of both Z-score and Z"-score conducted from all 5 years

The focus of this research was on using the Altman Z-Score formula to predict probability of bankruptcy by analyzing five financial ratios:

1. X₁ (Working Capital to Total Asset)

measures liquidity by comparing net current assets with total assets expressed as a percentage

$$X_1 = \frac{\text{Current Asset} - \text{Current liabilities}}{\text{Total Assets}}$$

2. X₂ (Retained Earning to Total Assets)

measures cumulative profitability by comparing retained earnings with total assets expressed as a percentage

$$X_2 = \frac{\text{Retained Earnings}}{\text{Total Assets}}$$

3. X₃ (EBIT to Total Assets)

measures actual productivity of company assets by comparing earnings before interest and tax with total assets expressed as a percentage.

$$X_3 = \frac{\text{EBIT}}{\text{Total Asset}}$$

4. X₄ (Equity Market Value to Total Liabilities)

measures how much company's is able to satisfy liabilities from market value of the equity. Equity market value is calculated by multiplying the outstanding number of shares with the price per share.

$$X_4 = \frac{\text{Market Value of Equity}}{\text{Book Value of Debt}}$$

5. X'₄ (Book Value of Equity to Total Liabilities)

measures how much company assets can decrease in value before the amount of debt exceeds the value of assets and the company goes bankrupt by comparing market value equity with book value of debt expressed as a percentage.

$$X'_4 = \frac{\text{Book Value of Equity}}{\text{Book Value of liability}}$$

6. X₅ (Sales to Total Assets)

measures management's ability to face competitive conditions by comparing sales with total assets expressed as a ratio.

$$X_5 = \frac{\text{Retained Earnings}}{\text{Total Assets}}$$

These five variables are weighted together using the Altman Z-Score formula and for rating , Z"-score which is:

$$Z_i = 1.2X_1 + 1.4X_2 + 3.3X_3 + 0.6X_4 + 1.0X_5$$

$$Z''_i = 3.25 + 6.56X_1 + 3.26X_2 + 6.72X_3 + 1.05X_4$$

3. RESULT AND DISCUSSION

3.1 Working Capital to Total Asset (X_1)

Working capital to total asset (X_1) shows better condition for PT Indo Tambangraya Megah Tbk from 2018 to 2022.

Table-2 : Working Capital to Total Assets PT Indo Tambangraya Megah Tbk year of 2018 - 2022 (in thousand USD)

Item	2018	2019	2020	2021	2022
Current Asset	766.450	469.389	409.638	988.024	1.908.545
Current Liabilities	389.897	233.288	207.300	364.743	585.613
Working Capital	376.553	236.101	202.338	623.281	1.322.932
Total Asset	1.442.728	1.209.041	1.158.629	1.666.239	2.640.177
(X_1)	0,26	0,20	0,17	0,37	0,50

Source: Writer's documentation

Working capital will be acquired by subtracting the current asset with current liabilities. The value of (X_1) was decreasing from 2018 to 2020 and then improving through 2022. The overall 5 years change of the value shows improving condition.

3.2 Retained Earning to Total Asset (X_2)

Retained earning to total asset (X_2) shows better condition for PT Indo Tambangraya Megah Tbk from 2018 to 2022.

Table-3 : Retained Earnings to Total Asset PT Indo Tambangraya Megah Tbk year of 2018 - 2022 (in thousand USD)

Item	2018	2019	2020	2021	2022
Retained Earnings	600.486	513.245	485.176	854.278	1.514.856
Total Asset	1.442.728	1.209.041	1.158.629	1.666.239	2.640.177
(X_2)	0,42	0,42	0,42	0,51	0,57

Source: Writer's documentation

The value of retained earnings to total asset increases from 2018 to 2022, the five years gain is about 35%, the number shows improvement in financial condition for PT Indo Tambangraya Megah Tbk from the year of 2018 to 2022.

3.3 EBIT to Total Asset (X_3)

This ratio shows improvement PT Indo Tambangraya Megah Tbk from 2018 to 2022.

Table-4 : EBIT to Total Asset PT Indo Tambangraya Megah Tbk 2018 - 2022 (in thousand USD)

Item	2018	2019	2020	2021	2022
EBIT	432.050	180.526	103.911	791.182	1.682.716
Total Asset	1.442.728	1.209.041	1.158.629	1.666.239	2.640.177
(X₃)	0,30	0,15	0,09	0,47	0,64

Source: Writer's documentation

There was decrease in (X₃) value between year 2018 to 2020 but the number was improving after 2019, the overall 5 years gain is more than 100% this indicates the strong financial recovery during the last 3 years of operation. The recovery after covid-19 may due to supply shortage and increasing coal demand.

3.4 Equity Market Value to Total Liabilities (X₄)

This particular ratio shows improvement PT Indo Tambangraya Megah Tbk from 2018 to 2022.

Table-5 : Equity Market Value to Total Liability PT Indo Tambangraya Megah Tbk 2018 - 2022 (in thousand USD)

	2018	2019	2020	2021	2022
Equity Market Value	1.480.351	857.141	1.012.487	1.491.316	2.852.873
Total Liabilities	472.945	324.576	312.339	464.680	689.897
Value of (X₄)	3,13	2,64	3,24	3,21	4,14

Source: Writer's documentation

Overall number is improving through 2022 indicating the stronger financial condition, since the sales was improving along with steady growth of increasing liabilities.

3.5 BVE (book value of equity) to Total Liabilities (X'₄)

BVE to total liability shows improvement PT Indo Tambangraya Megah Tbk from 2018 to 2022.

Table-6 : BVE to Total Liabilities PT Indo Tambangraya Megah Tbk 2018 - 2022 (in thousand USD)

	2018	2019	2020	2021	2022
Book Value of Equity	969.783	884.465	846.290	1.201.559	1.950.280
Total Liabilities	472.945	324.576	312.339	464.680	689.897
Value of (X'₄)	2,05	2,72	2,71	2,59	2,83

Source: Writer's documentation

Book value of equity shows drastic gain from 2020 onwards but the liabilities steadily increasing, this makes the number continue to improve.

3.6 Sales to Total Asset (X₅)

This ratio is stagnant over the 5 years, this means no significant improvement in terms of profitability based on asset for PT Indo Tambangraya Megah Tbk within the period of 2018 to 2022.

Table-7 : Ratio Sales to Total Asset PT Indo Tambangraya Megah Tbk, 2018 - 2022 (in thousand USD)

	2018	2019	2020	2021	2022
Sales	2.007.630	1.715.592	1.185.336	2.076.813	3.636.213
Total Asset	1.442.728	1.209.041	1.158.629	1.666.239	2.640.177
(X _s)	1,39	1,42	1,02	1,25	1,38

Source: Writer's documentation

Sales to total asset shows stagnation during 5 years of operation, this means the company is aggressively adding more investment in total assets but the sales is lagging to take the effect.

3.7 Z-Score and Z''-Score

Table 8 describes overall calculation and properties of both Z-Score and Z''-Score of PT Indo Tambangraya Megah Tbk within period of 2018 to 2022.

Table-8 : Result of Z-Score and Z''-Score, PT Indo Tambangraya Megah Tbk year of 2018 - 2022 (in thousand USD)

Item	2018	2019	2020	2021	2022
X ₁	0,26	0,20	0,17	0,37	0,50
X ₂	0,42	0,42	0,42	0,51	0,57
X ₃	0,30	0,15	0,09	0,47	0,64
X ₄	3,13	2,64	3,24	3,21	4,14
X ₅	1,39	1,42	1,02	1,25	1,38
Z-Score	5,15	4,32	4,06	5,91	7,37
X' ₄	2,05	2,72	2,71	2,59	2,83
Z''-Score	10,48	9,78	9,21	13,28	15,66

Source: Writer's documentation

The Z-Score throughout the last five years continue to improve while there are slight decrease in value for year 2019 and 2020, we can see that in this period, the market condition is declining, or it is not very preferable for the firm. After the covid-19 pandemic of 2020, the firm gained significantly in Z-score, this means the market condition continue to improve after the covid-19 pandemic. The overall Z-Score value is above 2,99 which is indicating the firm is in a safe zone with minimum to zero chance in bankruptcy. The firm is in a good financial condition based on Z-score. The Z''-Score also indicates very healthy condition for PT Indo Tambangraya Megah Tbk. Based on the value of Z''-Score, the company credit rating is AAA.

4. CONCLUSION AND RECOMMENDATION

4.1 Conclusion

Bankruptcy prediction analysis and financial condition was conducted on PT Indo Tambangraya Megah Tbk during the period of 2018-2022. The following results:

- a. Working capital to total asset ratio shows an improvement, PT Indo Tambangraya Megah Tbk had much more current assets than its current liabilities which is healthy.
- b. Retained earnings to a total asset ratio shows steady improvement through 2022 with overall gain of 35%.
- c. Equity market value to total liability ratio of the firm decreased significantly in the year of 2019 but continues to climb throughout 2022. The overall gain is 32% which is very good for the improving financial condition of the firm.
- d. The EBIT to total asset ratio of PT Indo Tambangraya Megah Tbk decreased for the first 3 years and gained drastically after the covid-19 pandemic. The coal market is improving after the pandemic and brought positive result to the firm. Overall value is good for the firm.
- e. Book value of equity to total liability ratio shows steady increase through 5 years of operation. The overall gain is about 37%.
- f. Sales to total assets ratio shows stagnation, this indicates that the company is aggressively adding more investment in total assets but the sales is lagging to take the effect.
- g. The Altman Z Score bankruptcy predictive model shows no sign of bankruptcy or distress for PT Indo Tambangraya Megah Tbk. The value of Z-Score is 7.37 or way above 2.99, it shows that the firm is in safe zone with zero or minimum probability of bankruptcy.
- h. The Z"-Score value was improving from 2018 to 2022, the last value is 15.66, indicating a very healthy financial condition. Based on the table 1, the current credit score classification of PT Indo Tambangraya Megah Tbk is AAA or the highest hierarchy credit class according to Altman.
- i. The predictive model shows no sign of financial distress or difficulties in the next two years for the firm.

4.2 Recommendation

The company was classified in a safe zone with AAA credit rating according to Altman Z-score model, no sign of financial distress occurred during the period of assessment. The recommendation is to continue the current business strategy and policy since there aren't any threats to the financial conditions for the firm. With the improvement of coal market, the company should focus on increasing operating efficiency to minimize cost and losses. The management should continue to seek efficient and lean production. With the cyclical nature of coal market, the firm should also consider the up swing and down swing of the coal prices, so the production management should be adjusted to the predicted coal prices. The pandemic event brought beneficial effect to the firm since the financial condition is improving after the event hit the global market. This anomaly may not happen often thus the firm should carefully handle this condition and stay aware and stick to prudent management practice. From Sales to total assets ratio, the firm is indicated taking aggressive investment in total assets but if we see from the cyclical nature of coal market, the firm in contrast, should hold to slow down the investment

6th International CEO Communication, Economics, Organization & Social Sciences Congress

during the topping price of coal instead adding more investment in the bottoming price of coal. Further research about coal price correlation in pandemic event is recommended to assess the detail of coal prices and can become a study material for coal price forecast.

ABSTRACT

The objective of this study was to evaluate the influence of inflation rate and other macroeconomic factors on the return of the Indonesian Composite Stock Index. In the last three years, the world has been dealing with unexpected events such as the COVID pandemic and the Russia-Ukraine conflict, leading to a notable increase in global inflation. Indonesia, however, has been able to keep inflation under control. Over the past decade, the country has experienced remarkable economic growth with an average GDP growth of 5%. This growth has also reduced the poverty rate to less than 10%, consequently, Indonesia was included in the G20 and was appointed as the Chair of the G20 in 2022. To understand the relationship between the Indonesian Composite Stock Index and several macroeconomic variables, we used Eugene Fama's efficient market hypothesis as the underlying theory. We conducted multiple regression analysis on quarterly data from 2012-2022, obtained from various benchmark websites. We found that GDP growth and bond yield had high impact on the return of the Indonesian Composite Stock Index, indicating that the stock market acted as a leading indicator for the selected macroeconomic variables. This was contrary to the efficient market hypothesis. The findings from this study provide useful information to all parties involved in the Indonesian stock market, including participants, regulators and policymakers. Our research indicates that macroeconomic factors have a significant influence on the stock market and should be considered when making decisions related to the stock market.

Keywords: Indonesia, GDP Growth, Inflation Rate, Bond Yield, Composite Stock Index

INTRODUCTION

ASEAN's (Association of Southeast Asian Nations) largest economy, the Republic of Indonesia (Republik Indonesia) is a country comprising 16,056 islands located between Asia and Australia. The five main islands Java, Sumatra, Kalimantan, Papua, and Sulawesi contain 34 provinces. The country has a dense, diverse population with varied cultural characteristics (e.g., language, customs, dance, and costume) and is also blessed with abundant natural resources (Eye on Asia, 2022).

Indonesia has seen its population grow from 238.5 million in 2010 to 268.1 million in 2019, a growth rate of 1.31%. In addition, its 2019 GDP (Gross Domestic Product) was IDR 15,833.9 trillion, more than 6% greater than its 2017 GDP of 14,838.3 trillion (Eye on Asia, 2022). Indonesia is consequently the fourth most populous country in the world and the 10th largest economy from the perspective of purchasing power parity. Moreover, the country has made tremendous progress in reduction of poverty, reducing the rate to under 10% in 2019 prior to the COVID-19 pandemic. The country also assumed the Presidency of the G20 (Group of Twenty) in 2022 encouraging all member nations to collaborate in the recovery from the impacts of the pandemic (World Bank, 2022).

Like other nations, Indonesia's economy was also adversely affected by the pandemic (Figure 1.1). The country moved to lower-middle income status from upper-middle income in the middle of 2021. Also, the pandemic somewhat cancelled the headway made toward poverty reduction as the rate increased to 9.7% in September 2021 from 9.2% in September 2019 (Figure 1.2). Nevertheless, the economy is in recovery with a projected GDP growth of 5.1% in 2022. This is anticipated to be supported by increasing commodity exports and a supportive fiscal policy to endure the pandemic (World Bank, 2022).

Following the economic shock due to the global pandemic and the precautionary measures taken to deal with it, Indonesia's central bank and the government have responded rapidly reliably. In the process, the authorities have tested the boundaries of macroeconomic policymaking, by utilising novel monetary instruments and delaying some Constitutional financial policies due to the exceptional circumstances. From a future perspective, protecting fiscal sustainability will necessitate improving the revenue base and implementing consolidation framework in the a medium-term, together with supporting more efficient public spending (OECD, 2021).

The review of empirical research related to the impact of macroeconomic variables on stock markets revealed that the focus of most studies is the impact of certain macroeconomic variables such as, interest rate, exchange rate, oil prices, on stock prices, stock indexes, or stock returns. Moreover, the same situation is also seen in studies set in the Indonesian context (e.g., Gunawan & Hendrawaty, 2018; Goh et al., 2021; Karim et al., 2018; Gunarto & Sembel, 2019; Amaliawiati et al., 2021; Permanasari & Kurniasih, 2021). Therefore, it appears that there is little research concerning the relationship between economic growth, bond yield, and inflation rate, on the returns of Indonesia Composite Stock Index. Consequently, this study tries to bridge the gap between prior research by studying the influence of economic growth, bond yield, and inflation rate, on stock market return, as measured by the returns of Indonesia Composite Stock Index.

LITERATURE REVIEW

2.1 Efficient Market Hypothesis

The basis of the EMH is that the prices in capital markets are efficient and fully reflect all available information in an unbiased manner (Fama, 1970). The EMH can be categorised into three forms: “weak form (stock prices reflect all past information in prices), semistrong form (stock prices reflect all past and current publicly available information), and strong form (stock prices reflect all relevant information, including information not yet disclosed to the general public, such as insider information)” (NASDAQ, 2023). The EMH suggests that in an efficient market, rivalry amid the investors who capitalize on profits will guarantee that all the pertinent information presently understood about variations in macroeconomic variables are reflected completely in present stock prices. Consequently, investors will be unable to receive abnormal profit by forecasting prospective movements of the stock market. Hence, it can be inferred that, there is no usefulness of previous (present) extents of economic activity in forecasting present (prospective) stock prices in a market that is informationally efficient (Mohsen, 2006). A later study by Malini (2019) found that the weak form of the EMH existed as regards the LQ45 index. Another study (Njindan Iyke, 2019) found that the EMH was rejected for nearly 29% of exchange rates signifying that the Indonesian FX market was inefficient in the long-term as regards certain currencies and profits could be derived by FX investors from such rates of exchange. Mubarok and Fadhli (2020) used monthly data for 1996 to 2020 on the Indonesian Stock Exchange and found that the market was inefficient in its weak form.

2.2 Economic Growth

Economic growth signifies a growth in the size of the economy of a country over a period of time. Typically, the size of an economy is measured by the economy’s overall production of goods and services, which is termed gross domestic product (GDP). Indonesia has seen its population grow from 238.5 million in 2010 to 268.1 million in 2019, a growth rate of 1.31%. In addition, its 2019 GDP (Gross Domestic Product) was IDR 15,833.9 trillion, more than 6% greater than its 2017 GDP of 14,838.3 trillion (Eye on Asia, 2022). Indonesia is consequently the fourth most populous country in the world and the 10th largest economy from the perspective of purchasing power parity. Moreover, the country has made tremendous progress in reduction of poverty, reducing the rate to under 10% in 2019 prior to the COVID-19 pandemic. The country also assumed the Presidency of the G20 (Group of Twenty) in 2022 encouraging all member nations to collaborate in the recovery from the impacts of the pandemic (World Bank, 2022). The data for the present study will be the quarterly GDP of Indonesia for the period 2012 until 2022 by Trillion-rupiah notation.

2.3 Bond Yield

A bond's yield is the return to an investor from the bond's interest, or coupon, payments. Return on bond investment is source of income for the investors who allocate their money to buy a

retail bond/corporate bond/government bond. One of the important thing that is to be considered before they decide to invest in bond is the amount of bond yield as a measurement tool to know the annually rate of return. There are two terminologies in calculating yield, current yield and yield to maturity. (Fabozzi, 2000). In this study, Indonesia 10-Year Bond Yield Historical Data for the period 2012 to 2022 was utilised.

2.4 Inflation rate

The economy is said to be experiencing inflation when the prices of most goods and services are increasing over time (Abel et al., 2011). Inflation rate is a measure of the annualized percentage change in the general level of prices in an economy. Another method to describe inflation, according to Singh T. et al. (2011), is the decline in purchasing power of the monetary unit of account, which acts as the medium of exchange. When the general price level rises, a given currency unit may be used to purchase fewer goods and services. One of the most significant indicators of price inflation is the inflation rate, which is the percentage change in a price index over time. The data utilised by the present study is the quarterly inflation rate of Indonesia for the period between 2012 and 2022.

2.5 Return of Indonesian Composite Stock Index

The Return of Indonesian Composite Stock Index is a key indicator of the overall performance of the Indonesian Stock Exchange. It tracks the average closing price of all stocks listed on the exchange over a 10-year period from 2012 to 2022. By calculating the average closing price per quarter, the return provides investors with a comprehensive snapshot of the stock market performance in Indonesia, expressed in Indonesian rupiah (IDR). This index serves as an important benchmark for investors to assess the investment climate in the country.

METHODOLOGY

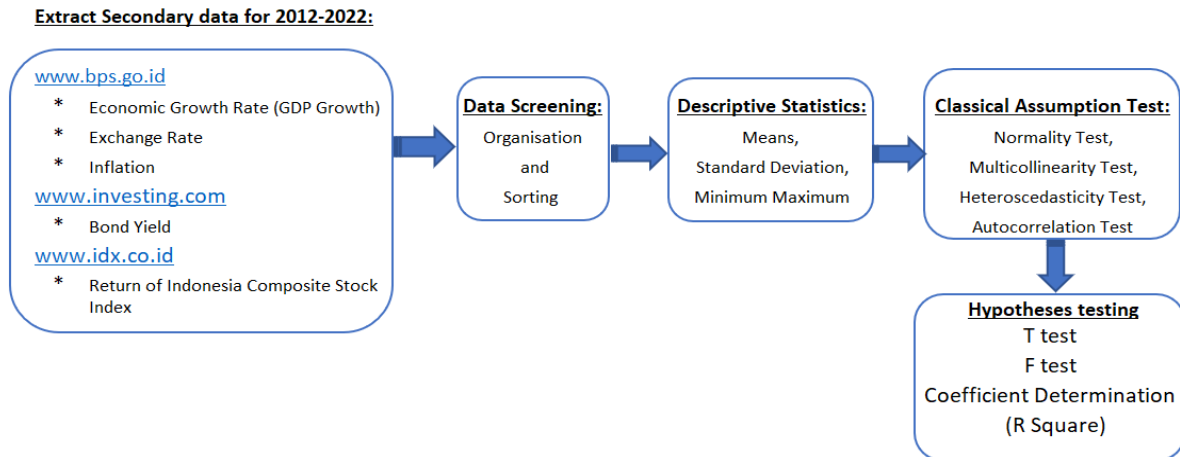

3.1 Data Types and Sources

The data for the study are quantitative secondary data obtained from various sources. The decision to use secondary data was due to the ease with which these could be accessed and also in the interest of time.

Data related to economic growth, bond yield and inflation rate were extracted for a period of 10 years, from January 2012 to December 2022. The rationale for choosing this 10-year period is to obtain more accurate outcomes. The following data were extracted for the study:

- a. Historical data on Indonesia 10-Year Bond Yield. This information is available on the website in.investing.com.
- b. Bank Indonesia's Indonesian Financial Statistics (www.bi.go.id) provides a comprehensive overview of the monetary conditions in Indonesia including the economic (GDP) growth, inflation rate and exchange rate of the rupiah against the U.S. dollar. This data was used to assess the inflation rate over the period from January 2012 to December 2022.
- c. Data related to stock prices were obtained from the Stock Exchange Composite Index (www.idx.co.id) which contains a comprehensive and accurate record of the stocks issued by publicly traded companies from January 2012 to December 2022.

3.2 Research Framework

3.3 Data Analysis

The following tests were utilised for analysing the data.

1. **Descriptive statistics:** The mean and standard deviation for the data were computed. The mean signifies the average values in the series and the standard deviation signifies the spread or dispersion of the series. In addition, the minimum and maximum values of data in the series were also obtained.
2. **Classical Assumption Test:**
 - a. **Normality Test :** The normality test is used to test whether the regression model is deep this study has residuals that are normally distributed or not. An indicator of a good regression model is having normally distributed data. The way to detect whether the residuals are normally distributed or not can be done with the Kolmogorov-Smirnov non-parametric statistical test (K-S) test contained in the SPSS program. The data distribution can be said to be normal if the significant value is > 0.05 (Ghozali, 2018: 161-167).
 - b. **Multicollinearity Test :** The multicollinearity test is used to test whether a research regression model has a correlation between independent (independent) variables. A good regression model is one that does not have a correlation between the independent variables and is free from multicollinearity symptoms. Knowing whether or not there are symptoms of multicollinearity is by looking at the value of the VIF (Variance Inflation Factor) and also the Tolerance value. Tolerance measures the variability of the selected variable which is not explained by other independent variables. The values used to indicate the presence of multicollinearity symptoms are VIF values < 10.00 and Tolerance values > 0.10 (Ghozali, 2018: 107).

- c. **Heteroscedasticity Test** : The heteroscedasticity test aims to test whether in the regression model there is an inequality of variance from the residual one observation to another (Ghozali, 2018: 120). Heteroscedasticity testing can be done by looking at the scatterplot graph between SRESID and ZPRED, namely whether there is a certain pattern or not. The basis for decision making is as follows:
If there is no clear pattern, and the points spread above and below the number 0 on the Y axis, then there is no heteroscedasticity (Ghozali, 2018: 137-138).
- d. **Autocorrelation Test** : The autocorrelation test is the relationship between the residuals of one observation and the residuals of other observations (Winarno, 2015: 5.29). According to Ghozali (2018: 111) The autocorrelation test aims to test whether in the linear regression model there is a correlation between the confounding errors in period t and the interfering errors in the t-1 (previous) period.
3. **Partial (T) test** : The t test is used to determine the effect of GDP, Bond Yield, and Inflation to Stock Return (partially). The t test can be done by comparing t count with t table (Ghozali, 2018:78). At a significant level of 5% with the test criteria used as follows:
 If $t_{count} < t_{table}$ and $p\text{-value} > 0.05$ then H_0 is accepted and H_a is rejected, which means that the X has significant effect to Y.
 If $t_{count} > t_{table}$ and $p\text{-value} < 0.05$ then H_1 is accepted and H_0 is rejected, which means that X has no significant effect to Y
4. **Simultant (F) Test** : The F test is used to test the effect of GDP, Bond Yield, and Inflation to Stock Return. According to Ghozali (2018: 79) testing can be done by comparing the Fcount value with Ftable at a significant level of <0.05 with the following test criteria:
 If $F_{count} > F_{table}$ and the p-value of F-statistics <0.05 then H_0 is rejected and H_1 is accepted, which means all independent variables have significant effect to dependent variable.
 If $F_{count} < F_{table}$ and the p-value of F-statistics <0.05 then H_0 is rejected and H_1 is rejected, which means all independent variables have no significant effect to dependent variable.
5. **Coefficient Determination (R Square) Test** : The coefficient of determination test (R^2) is used to measure the level of ability of all independent variables in explaining the dependent variable. . If the adjusted R^2 value gets closer to one (1), the better the model's ability to explain the dependent variable (Ghozali, 2018: 286). Figure 3.1 depicts the flow of data processing in the study.

RESULT AND DISCUSSION

4.1 Partial Test (T Test)

Coefficients for the impact of macroeconomic factors on the Return of Indonesian Composite Stock Index

Variables	Coefficient	t-value	p-value
(Intercept)	69.335	3.508	
GDP growth	1.898	3.133	0.003**
Bond yield	-21.401	-3.470	0.001**
Inflation rate	-3.146	-1.929	0.061*

** significant at 5%, * significant at 10%

Source: SPSS Report by Author (2022)

According to the result above, we can make some conclusion:

1. Sig value of GDP is 0.003 and alpha is 0.05. it mean Sig value of GDP lower than alpha, H1 accepted, so we can say if GDP growth has significant effect to Return of Indonesian Composite Stock Index.
2. Sig value of Bond Yield is 0.001 and alpha is 0.05. it mean Sig value of Bond Yield lower than alpha, H2 accepted, so we can say if Bond Yield has significant effect to Return of Indonesian Composite Stock Index.
3. Sig value of Inflation Rate is 0.061 and alpha is 0.05. it mean Sig value of Inflation Rate greater than alpha, H3 rejected, so we can say if Inflation Rate has no significant effect to Return of Indonesian Composite Stock Index.

4.2 Discussion

The stock market of a country appears to be the centre of all the transactions pertaining to a country’s financial growth. Many factors can indicate to market participants whether higher or lower returns can be obtained when investing in this market. Keeping this in mind, the overall objective of this study was to examine the effect of four macroeconomic factors (GDP growth, bond yield and inflation rate) on the Return of Indonesia Composite Stock Exchange. Specifically, the study used different statistical tests to investigate whether changes in the chosen macroeconomic variables had an impact on the Return of Indonesian Composite Stock Index. The study utilized correlations and multiple regression analysis to investigate the relationships. The outcomes of the multiple regression analysis revealed that only GDP growth and bond yield have a significant impact on Return of Indonesian Composite Stock Index. However, the other macroeconomic variables namely inflation rates did not have a significant impact on the Return of Indonesian Composite Stock Index.

The results of hypothesis testing which show that GDP has a positive and significant effect on stock returns are consistent with the results of Gunarto and Sembel's research (2019). According to Tandelilin (2014: 342) estimated GDP will determine economic development, because GDP comes from the number of consumer goods that are not capital goods. GDP is basically the total added value generated by all business units in a particular country, or is the total value of final goods and services produced by all economic units (Sukirno, 2011). GDP at current prices can be used to see shifts and economic structure, while constant prices are used to determine economic growth from year to year. Many previous studies, set in different countries, have also studied the impact of similar macroeconomic variables on stock returns

and/or stock index. Overall, the findings of the present study as regards the effect of GDP growth, inflation rate, bond yield, and exchange rate, on the stock market index are confirmed or supported by various studies. It may be noted that the findings of the present study did not find exact parallels in prior studies as some of them were aligned as regards only one or a few of the studied macroeconomic variables.

According to the statistical result, Government bond yield has a negative and significant impact to stock return. The cost of capital (COP) is the rate of return required by a company to cover its opportunity cost of borrowing money. It measures how much investors are willing to pay for the risk that investment will yield less than expected. The higher the risk, the lower the return investors require and vice versa. Bond yields are a key factor in determining the cost of capital for companies and investors. Corporate bond yields are determined by the interest rates that governments pay on bonds, which are typically higher than the interest rates paid on government securities. Since most bonds have fixed interest rates and do not adjust based on inflation, they suffer from what is known as "negative real yield," meaning they lose value over time. However, bond yields can also be affected by changes in other factors such as prevailing interest rates or stock market volatility. When bond yields fall below their original nominal value, this indicates that investors have less faith in their ability to make money with those investments. This is often referred to as "contagion" because it spreads across all types of bonds and affects all levels of investors in different ways.

An earlier study by Ikoku (2014) found that inflation had an impact on the stock returns of the F&B sector in Nigeria. A study set in Bangladesh's Dhaka Stock Exchange by Quadir (2012) found that there was a positive, non-significant relationship between treasury bill interest rate and industrial production and the stock returns. In the context of five SAARC nations (Bangladesh, Nepal, India, Sri Lanka, and Pakistan), Sharif (2017) found that rates of interest, inflation, and unemployment, and rate of exchange, are negatively and significantly related. Also, GDP per capita and net inflows of foreign direct investment, and rate of exchange, are positively and significantly related. Rjoub et al. (2009) found that there was a significant pricing relationship between the stock return in the ISE (Istanbul Stock Exchange) and unanticipated inflation. In addition, this study found a significant relationship between stock return and exchange rate. In contrast to the present study, Ouma and Muriu (2014) found that inflation was found to be a significant aspect affecting the returns at NSE. This study also appears to be among the first to investigate the impact of bond yield on the stock market returns. Prior studies have found that bond yields were impacted by exchange rates but not inflation (Permanasari & Kurniasih, 2021) or that bond yields had late impacts on stock returns (Celebi & Hönig, 2019).

Conclusion

This study explored the effect of macroeconomic variables, such as Gross Domestic Product (GDP) growth, Bond Yield (BY), Exchange Rate (ER) of the Rupiah against USD, and Inflation Rate (IR) on the Return of the Indonesian Composite Stock Index from 2012 to 2022. The analysis revealed that GDP growth had a positive effect on the Return of Indonesian Composite Stock Index, while Bond Yield, Exchange Rate, and Inflation Rate had a negative effect. This finding is highly significant, providing investors with valuable insights that can be used to maximize their portfolio returns. Moreover, the results of this study were compared to previous

research, which yielded both consistent and contradictory findings. This implies that further research is needed to understand the influence of macroeconomic variables in different contexts and over different time periods. Such investigations can help to uncover the working mechanisms of macroeconomic variables on stock market returns and can provide investors with more accurate insights. Finally, a deeper understanding of macroeconomic variables can help to create a more informed investment climate and can provide investors with the knowledge they need to maximize their portfolio returns. This study provides a valuable contribution to the current body of literature and can be used as a foundation for further research into the macroeconomic effects on stock market returns.

ABSTRACT

The Indonesian Ministry of Environment and Forestry (KLHK) noted that Indonesia produces 18 million tons of waste in 2022. Referring to the 2022 data provided by SIPSAN-MKLH (Sistem Informasi Pengelolaan Sampah Nasional – Kementerian Lingkungan Hidup dan Kehutanan), Indonesian plastic waste contributes around 18.2% of the waste composition compared to 11.3% of paper waste. Paper packaging as one of the green products has been introduced as an alternative solution to substitute plastic packaging. Therefore, an extended Theory of Planned Behaviors was employed along with Green Trust to study the relationship between these variables with Green Purchase, a moderation effect of Green Advertisement has been also introduced to strengthen the Green Trust variable. This research concludes that Attitude has a positive significant impact on Green Purchase Intention, Subjective Norm also found has significant effect to Green Purchase Intention, However Perceived Behavioral Control, Green Trust, and Moderation of Green Advertisement on Green Trust has no significant effect on the Green Purchase Intentions. According to the R^2 values, the Green Purchase Intention can be explained by the construct variables of Attitude, Subjective Norm, Perceived Behavioral Control, Green Trust is 45.1%. Some opportunities for future study based on this finding can be explored for different variable such as product price, Price Incentive, government regulation with reward and punishment that might have the different result compared to this research. Qualitative research might be needed to get a deeper insight from the end user, industry, and regulator (government).

Keywords: Paper Packaging, Theory Planned Behavior (TPB), Green Trust, Green Advertisement, Green Purchase Intention

1. INTRODUCTION

The Ministry of Environment and Forestry (KLHK) noted that Indonesia produces 18 million tons of waste in 2022. Referring to the 2022 data provided by SIPSN-MKLH that Indonesia plastic waste contribute around 18.2% of the waste composition as compared 11.3% of paper waste. Plastic waste of DKI Jakarta waste contribute 14.18% of total waste generated where is paper/board contribute 14.17% and most of the plastic contribute from the packaging used. Paper packaging is a packaging that is wood-based and more environmentally friendly as an alternative packaging product. This study tries to implement the extended Theory Planned Behavior (TPB) variables, Green Trust, and Moderation of Green Advertisement as new approach for this research in the context of Paper Packaging to substitute plastic packaging.

2. LITERATURE REVIEW

2.1 Theory of Planned Behavior (TPB)

TPB is an extension of the Theory of Reasoned Action (TRA; Fishbein & Ajzen, 1975), has been the dominant theoretical approach to guide research on health-related behavior for the past three decades. The theory is well recognized amongst researchers and is also familiar to many students, practitioners, and policymakers. TPB model has been useful in predicting consumer's intention as well as behavior in a wide range of green/ pro-environmental areas, such as energy efficient products (Ha and Janda, 2012), Green Product (Paul, J. Modi and et all, 2016) and organic products (Zagata, 2012).

2.1.1 Attitude

Attitude has long been identified as a construct that guides future behavior or the cause of intention that ultimately leads to a particular behavior. In TRA, attitude is referred to as the evaluative effect of positive or negative feeling of individuals in performing a particular behavior(Ajzen & Fishbein, 1975).

2.1.2 Subjective Norm

Subjective norm relates to the perception of social pressure to perform an intention and involving believes that other individual or group think he or she should perform the intention(Ajzen & Fishbein, 1975). Subjective norms are the social pressure exerted on an individual to do something(Ajzen, 1991).

2.1.3 Perceived Behavioral Control

The concept of perceived behavior control is concerned with an individual's assessment of their capacity to engage in behavior (Ajzen, 1991). In a similar vein, it referred to readily available resources like purchasing power. The concept of perceived behavior control was initially introduced in a study by Ajzen (1991).

2.2 Green Trust

Green trust is a willingness to rely on a product or service based on the beliefs or expectations arising from its reputation, credibility, benevolence, and ability for environmental performance (Chen, 2010)

2.3 Green Advertisement

Green advertising is defined as “Any ad that meets one or more of the following criteria: (1) explicitly or implicitly addresses the relationship between a product/service and the biophysical environment, (2) promotes a green lifestyle with or without highlighting a product/service, and (3) presents a corporate image of environmental responsibility”.

2.4 Green Purchase Intention

A study by Rashid, N. R. N. A. (2009). defined green purchase intention of a person as preference to products with eco-friendly features over other conventional products in their purchase considerations. Similarly, Chen and Chang (2012) stated the willingness of a consumer to buy a particular product according to his or her environmental needs is considered as the green purchase intention.

2.5 Research Framework

Based on the previous explanation of interaction between variables, hence the research framework and hypothesis has been developed as follows:

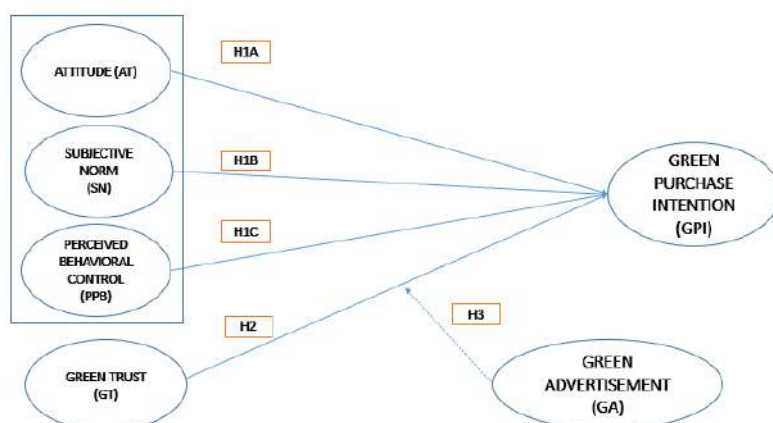

Figure 2. 1. Research Framework

Source: Author, 2023

Based on the framework shown in Figure 2.5 the following hypothesis has been developed

- H1: Attitude towards behavior has a positive effect on Green Purchase Intention
- H2: Subjective norms has a positive effect on Green Purchase Intention
- H3: Perceived Behavioral Control has a positive effect on Green Purchase Intention
- H4: Greet Trust (GT) has a positive effect on Green Purchase Intention
- H5: The relationship between Green Trust (GT) and Green Purchase Intention (GPI) would be stronger when Green Advertising be the moderating

3. DISCUSSION AND FINDING

3.1 Relationship between Theory Planned Behavior (TPB) Variable and Green Purchase Intention

3.1.1 Attitude and Green Purchase Intention

It is found in this research that that Attitude has the significant effect to Green Purchase Intention. According to (Orzan, et al ,2018), Dalila, et all (2020), Most respondents are aware of the impact of packaging on the environment, the main reasons for purchasing are environmental protection, recycle and the feeling of being responsible. Packaging preferences include paper, glass, and cardboard and, to a lesser extent, plastic, and wood. Also, attitudes, subjective norm, and perceived behavioral were all found to have had significant effects on the intention to use and the actual behavior. In this case, paper packaging has been acknowledged and accepted as an alternative packaging to substitute plastic packaging. In this study shown that attitude of the respondent has the positive correlation on the green purchase intention of paper packaging as the substitution of plastic packaging. Refer to the variable measurement on the Attitude shown that value of 4.2 – 4.6 Likert scale which means most of the respondent agree on all the indicator related to Attitude such as feel positive on green packaging such as paper packaging, this green product will be good for environment and, they like the idea of purchasing the green product such as paper packaging. This is indicated as well by feedback from respondent such as respondent 12 (Male, 36-41, DKI Jakarta, Businessman/Entrepreneur), stated “Because I want to contribute to reducing plastic waste.” For the question of why it is necessary for people to move from paper packaging to plastic packaging. Based on his statement show that it is personal attitude play a big role on the decision whether to buy or not to buy the green packaging.

3.1.2 Relationship between Subjective Norm and Green Purchase Intention

It is found in this research that that Subjective Norm has the significant effect to Green Purchase Intention. According to (Judith de Groot1 and Linda Steg,2007), (Dalila, et all (2020) It has been proven that subjective norm has a positive impact towards green purchase intention. It is interesting to see the that the average Likert scale value for this Subjective Norm found at the level at 3.65 which means an uncertainty if they agree, or they disagree if other people impact their decision related to the green packaging just because they do it or they feel the respondent must buy it just because they do or they feel the respondent should do. Subjective norm relates to the perception of social pressure to perform an intention and involving believes that other individual or group think he or she should perform the intention(Ajzen & Fishbein, 1975). Refer to respondent 1 (Male, 36-41 years old, DKI Jakarta, Private Employee) feedback stated that “For our future generations (son and grandson) to be better” on the question of why we should move from plastic packaging to paper packaging related to its impact to environment. It shown that respondent has a concern on their loved family future when it comes to future possible bad impact due to worsen environment condition then it may drive their intention to execute the green purchase intention by buying the paper packaging.

3.1.3 Relationship between Perceived Behavioral Control and Green Purchase Intention

It is found in this research that that Perceived Behavioral Control has not significant effect to Green Purchase Intention in the context of plastic packaging substitution by paper packaging. Perceived behavioral control measures the person's belief of how easy or difficult it is to perform a behavior, and it explains the effect of non-volitional factors on behavioral outcomes (Ajzen. I et all,1986). According to (Orzan G, et al ,2018), Dalila, et all (2020), (Judith de Groot1 and Linda Steg,2007) that Perceived behavioral control has a significant impact on the green purchase intention. However, in other research of Liang, D., Hou, C., Jo, M.-S., & Sarigöllü, E. (2018) found that perceived behavioral control has not significant impact towards green purchase intention. One of the reasons could be the lack of indicator to represent the perceived behavioral control variable in this research which shall be improved for the next researcher. Other reason could be because of the different context of different industry which could give different conclusion, found most of the earlier research done based on literature study such as transferium (Judith de groot and linda steg, 2007), Food packaging (Dalila, et all, 2020) and for a contextual study (Liang, D et all (2018). However, in this paper packaging context, based on the respondent feedback the availability in market, performance, convenience, and price maybe the root cause on why it is not easy. Respondent 1 (Male, 36-41 years old, DKI Jakarta, Private Employee) expect that the paper packaging can hold the liquid penetration longer, it is a good insight for the paper packaging producer to improve the experience of user towards the paper packaging especially when it is used for liquid packaging. Respondent 19 (Female 30-35 years old, DKI Jakarta, Private Employee) highlighted the price different between plastic packaging and paper packaging, this is also strengthened by respondent 27 (Male, 30-35 years old, DKI Jakarta, Private Employee) and Respondent 30 (Male, 48-53 years old, DKI Jakarta, Private Employee) who also comment that higher price could make the campaign difficult. Both respondent (27 and 30) stated also that the availability in market would be another clue to significantly increase the correlation between Perceived Behavioral Control and Green Purchasing.

3.2 Relationship between Green Trust and Green Purchase Intention

In this research found that there is no significant effect of green trust towards green purchase intention. In the previous research. (Amin, S. and Tarun, M.T., 2021), (Al-Quran, Ali Zakariya, et al. 2020) (Wasaya, Allah et all,2021), (Chen, Y., & Chang, C., 2012, it is found that the relationship between the green trust and Green Purchase Intention has a significant effect. However, While Saeed M.Z. A. Tarabieha*, (2020) found that the green trust has no significant impact on the green purchase intention. Various result could be due to the different context of the study. In the context of paper packaging, it is found that the claim of green of paper packaging has no correlation with the purchase intention due to environmental consideration. This might be due to some doubts from the respondent on the claim made by the paper packaging seller. One of the concerns could be the greenwashing. As per feedback from respondent 11 (Male, 36-41 years old, DKI Jakarta, Private Employee), he suggests an action needed to prove that the green campaign by paper packaging is trustworthy and it is not just a

business or political movement from some stakeholders, in example is the green washing. Greenwashing is a term used to describe a false, misleading, or untrue action or set of claims made by an organization about the positive impact that a company, product, or service has on the environment. Respondent 20 (Male, 24-29 years old, Domicile at Other, Private employee) suggest not to use trees in Paper Packaging. Almost similar feedback from Respondent 35 (Female, 30-35 years old, Bogor, Private employee) suggest using recycle paper instead of by cutting down trees in paper packaging production. It shown the low awareness on how the paper packaging being produced and whether all raw material and production process it is truly environmentally friendly. This same feedback comes from respondent 8 (Male, 42-47 years old, DKI Jakarta, Private Employee) who commented that he expects that the paper packaging will not create another environmental issue such as forest sustainability issues. Based on all the insight above it is required for the paper packaging industry stakeholders to improve the communication on why and how the paper industry will not be contributor to the environmental issues. That information shall be provided and very well communicated to the audience so there will no assumption or suspicious from packaging user that this all claim related to no or lower environmental impact of paper packaging is truthful and trustable.

3.3 The Moderating Effect of Green Advertisement on the relationship between Green Trust and Green Purchase Intention

In the previous research, it is found that the relationship between Green Trust and Green Purchase Intention has the various result. According to Chen, Y. and Chang, C. (2012), Wasaya, Allah et all (2021), Rahardjo FA (2015), Green Trust has significant effect on Green Purchase Intention. While Saeed M.Z. A. Tarabieha*, (2020) found that the green trust has no significant impact on the green purchase intention. In this research found that the moderation of green advertisement also has no significant impact towards relationship between green trust and green purchase intention in the context of paper packaging usage as an alternative packaging to substitute plastic packaging. Green Advertisement is not significantly increasing the Green Trust of respondent, so it has limited impact on the green purchasing or less potential of buying paper packaging instead if plastic packaging. Based on the survey made by researcher on the variable Green Advertisement, low impact of Green Advertisement towards Green Trust could be the quality of green advertisement, respondent 7 (Male, 48 -53 years old, DKI Jakarta, Private Employee) suggest that “An effective green advertisement is one that features examples and testimonials from people who have switched to paper packaging. This can help inspire other consumers to do the same and provide concrete evidence that switching to paper packaging can be done”. this testimonial could be shared or broadcast through social media such as Facebook, LinkedIn, and other broadcasting tool such as TV and Radio. Respondent 23 (Male, 36-41 years old, DKI Jakarta) on question of what kind green advertisement which should be more effective stated that “The advertisement contains information about the source of paper packaging, how the process is made, what paper packaging can use, how this paper packaging can be decomposed and reused according to the circular economy concept”. This feedback basically describe on the necessities of paper producer to give an education on how and why

paper is more environment friendly as compared to packaging. This is also strengthened by respondent 27 (Male, 30-40 years old, DKI Jakarta, Private employee) stated that type of the green advertisement which is required are “educative ads that can change perspectives” which means a massive educative advertising required in order change the perspective of people towards the paper packaging. This is highlighted by respondent 35 (Female, 30-35 years old, Bogor, Private Employee) who expect that the green advertisement available in every market, she said” Green advertisement that is always in every shop/supermarket” on the question of what type of advertisement expected. Almost similar comment from respondent 21 (Male, 36-41 years old, Tangerang, Private Employee) who stated that “Conduct outreach in many public locations.” As feedback on kind of Green Advertisement expected. In term of quality, Overall, the quality, intensity, availability, and content of the Green Advertisement contribute a lot in increasing the green trust and awareness of the respondent on the impact of paper packaging towards environment from raw material, production process and after it is becoming waste.

4. CONCLUSION

The first conclusion from the research is that there is a positive and significant relationship between Attitude and Green Purchase Intention. Secondly, it is also proven that there is a positive and significant relationship between Subjective Norm and Green Purchase Intention. Thirdly, it is found that Perceived Behavioral Control does not have significant effect towards Green Purchase Intention. Fourthly, it is found that Green Trust also does not have a significant impact on the relationship with Green Purchase Intention. Fifthly, it is found that there is no significant moderation effect of Green Advertisement on the relationship between Green Trust and Green Purchase. The author now can have a deep understanding of the relationship between variables and can take some insights on waste related issues and the future business plan within the paper industry.

4.1 Contribution of the Study

The main contribution of the study was to the several stakeholders of waste management and papermaking industry specifically whoever involved in paper packaging industry. The founding of this research will contribute additional knowledge in terms of the relation of the Attitude, Subjective Norm, Perceived Behavioral Control, Green Trust, Moderation of Green Advertisement and Green Purchase Intention.

4.1.1 Theoretical Implication

This research contributes to the variety to explore the relationship between Attitude, Subjective Norm, Perceived Behavioral Control, Green Trust, and Green Purchase Intention. This research contributes to the variety to explore the relationship between Attitude, Subjective Norm,

Perceived Behavioral Control, Green Trust, and Green Purchase Intention. In this research found that Attitude and Subjective Norm has positive and significant impact on the Green Purchase Intention. However Perceived Behavioral Control, Green Trust and Green Advertisement as moderating variable of Green Trust has no significant impact on Green Purchase Intention. The research also will be benefited to other researchers who will examine the same variable in other industries. It also empirically measures the Green Purchase Intention in Indonesia for product category packaging material especially paper packaging base.

4.1.2 Practical Implication

The result shows that only Attitude and Subjective Norm are significantly established the relationship with Green Purchase Intention, it is also found that Perceived Behavioral Control, Green Trust, and The Moderation of Green Advertisement does not impact the Green Purchase Intention. This finding is an important insight or clue for Jakarta or Indonesia Waste stakeholders to find best and effective way in reducing the packaging waste and its impact towards environment & also an important insight for Paper Packaging producer to get more market shares and win more trust from the end user. From the study has been observed that the Green Purchase Intention mostly come from the personal attitude and some influence of people surrounding or the important person close to each people such as family and friends. Government or Papermaking industry could take this insight in arranging a campaign for this substitution by creating long term program of Green Personal Value Branding or Green Social Value Group Branding in the movement campaign. Further it is also observed in this research that the Perceived Behavioral Control, Green Trust, and the moderation of Green Advertisement has not given the positive impact on the Green Purchase Intention. Based on the feedback of questionnaires from the respondent, has shown the papermaker need to focus to ensure the same convenience experienced when people change the packaging from plastic to paper, also there are some expectations on the same or lower price given for this substitution. There are several potential reason on why the green advertisement is not really effective to influence the respondent or people to move from plastic packaging to paper packaging such as lower level trust on the green claim, ineffective advertisement content and the availability as we all as the accessibility of the green advertisement , this could be another hints for the government or paper producer in order to create a more effective educational Green Advertisement which should cover the on how the paper packaging industry is harmless towards environment

4.2 Limitation of The Study

This study was designed to examine the potential of paper packaging to replace or substitute plastic packaging, the main idea is to reduce the plastic packaging waste impact towards environment, which the condition might be different across the category and others type of packaging or waste. The study also based on the questionnaire gathered from IPMI International

Business School as respondents in DKI Jakarta Indonesia, which may be also different result in different area or country.

4.3 Recommendation for Future Study

Some opportunities for future study based on this finding can be explored for different variable such as product price, Price Incentive, government regulation with reward and punishment that might have the different result compared to this research. Qualitative research might be needed to get a deeper insight from the end user, industry, and regulator (government).

ABSTRACT

The high number of internet users that surged during the pandemic caused for a change of shopping trends among the Indonesians, and the beauty industry took the opportunity to enlarge their targeted customers through the use of online shopping platforms, when offline stores were not available during the pandemic in 2019. The purpose of this study is to study and understand the effect that online customer reviews, specifically Review quality and Review quantity, as well as the customer's attitude towards locally products makeup. This study has 3 Independent variables (Review Quality, Review Quantity, and Customer attitude). The Research is a quantitative study, and the methodology used was spreading a questionnaire to 160 Indonesians living in the city of Jakarta and Bekasi, between the age of 18-51 years old. The study used a questionnaire with a respond system of Likert Scale of 5, and collected data was analyzed using Spearman correlation with the software of SPSS 23. The findings indicated that the 3 independent variables have significant positive correlation with purchase intention. Thus, understanding the role of Reviews and Customer Attitude can be a low-cost marketing strategy for local brands.

Keywords: Review Quality, Review Quantity, Customer Attitude, Local makeup Products, Purchasing Intention.

INTRODUCTION

The increasing number of users of online shopping platforms in Indonesia being approximately 224 million people (*Statista* 2023). The stores which trade their products online benefit from numerous studies conducted to understand the expectation of their customers. A study conducted by Deloitte 2021 was able to identify cities in Indonesia like Jakarta, Bandung, Surabaya, Medan, and Makassar, where a number of customer necessities were categorized and growing necessities like internet services was at 6% under food, education, health care. And cosmetics and beauty care products were at 4% on top of clothing, gadgets, household appliances and insurances (Deloitte, 2020). Customer shopping behavior is now being studied from the perspectives of e-commerce platforms that have attributes which heavily affect an individual's purchasing intention, as well as their contextual situation or attitude towards certain products will cause a customer to question their shopping habits. Therefore, this study aims to discuss the enhancement of online shopping trends specifically for the cosmetic industry's growth.

1. CHAPTER

1.1 Background of The Study

The occurrence of COVID-19 in the early months of 2020 quickly alarmed Indonesia, as a high tourist country the government had implemented thermal detectors, as well as spread awareness among officials about the rising risk of the disease since early January 2020 (A.G. Harggara 2020). In response to the growing cases of Covid-19 the Indonesian Governor Anies Baswedan imposed the Large-Scale Social Restriction (PSBB) in the month of April, where most activities and public visited spaces like shopping places were closed and fully restricted to the citizens. Individuals living in the city of Jakarta were accommodated into working from their homes and continuing their daily activities through the online media, thus also a high rise on the online shopping platforms as individuals now had the opportunity to access their necessities online.

The cosmetic industry is one of the leading industries in the world, offering products from skin care toners, cleansers, or makeup beauty products such as foundations, compact powders, eyeshadows, lipsticks, blushes (Chin, Harizan, 2017), thus, the addition of products from different kinds was enhanced by the ability to sell these products through the online shopping platforms during Covid-19. The immense growth of the Beauty care industry in Indonesia also was partially influenced by the majority of Indonesian women that purchased online. The Indonesian Central Statistics Agency (BPS) noted the cosmetics industry which is a part of the pharmaceutical and traditional medicine industry has grown over 9.61% in 2021 (PT. Sinergi Multi Lestarindo 2023). Even with the consideration of the ongoing pandemic in the years of 2020-2023, the younger generations which were more actively involved in online shopping platforms were able to influence the growth of the industry. According to Statista 2021 the Indonesian cosmetic market revenue growth in 2017 was 6.4%, in 2018 6.5%, and in 2019 6.6%, by 2021 it was 9.61% high. Thus, COVID-19 functioned as a catalyst for e-commerce that drove Indonesian customers to adopt e-commerce during the year of 2020, over

78% of internet users in Indonesia had purchased something online from their mobile phones (We are social report 2020).

The growing local products also offer great results as well as better prices for the customers (Statista in 2020). The two types of makeup sold in the Indonesian market include the drugstore makeup and the high-end makeup products, the high-end makeup products are targeting customers from the economic level of medium to high, while the drugstore makeup products are from low to medium economic level. This study intends to focus on the drugstore local makeup products, which often include brands such as Wardah, Somethinc, Emina, Makeover, Luxcrime, BLP, Dear Me Beauty, Looke Cosmetics, ESQA and etc.

A customer's expectations when purchasing makeup products, first is to have the ability to test the product, the feasibility of a product will heavily influence the purchase intention of the customer. The in-store experience will also influence the customer as they have the help from the sales people at the physical store, unless the customer's purchasing intention is to purchase a product again. Before COVID-19 customers would rather purchase from offline stores because of all the factors that would affect their buying decisions of these products. However, with the acceleration of the e-commerce growth, Indonesian customer purchasing activities were driven to be done online. An interview done by *Statista* showed that around 55% of Indonesians were doing online shopping because of COVID-19 during the year of 2020, and less than 10% were not doing any online shopping or purchasing.

1.2 Research Gap

In regards to previous research, studies done before the year of 2020, did not consider other phenomena like the occurrence of pandemic or COVID-19 to be specific. There was research conducted by an Indonesian student regarding the effect of reviews both quantity and quality, source credibility, and review valence towards purchase intention of customers, the research explained that the four factors had a positive effect on the purchasing intention. However, the study was mainly focused on the purchase intention of premium cosmetics in Indonesia (Susanto and Aprianingsih, 2016). Another research focused on the effect of brand loyalty towards purchase intention of Korean makeup brands sold in Indonesia, its relevance on the aspects of what consideration might be taken for customer purchase intention will be used for this study, however, the variables used in this study are different (Shalehah, Moslehpour, et al 2019). In addition, the previous research was conducted pre-Covid-19 which further enhances the need for a new analysis on the topic, as customer purchasing trends have changed and are leaning towards purchasing local makeup products.

1.3 Problem Statement

The Changing shopping trends and methods amidst Covid-19 opposed a barrier for customers to purchase makeup from physical stores, shifting customer purchasing focus to online shopping platforms as main mediums of selling makeup products. A survey conducted by Deloitte showed that during Covid-19 pandemic many customers of e-commerce platforms were heavily impacted by the lack of trust they have on the online shopping platforms, and it

further hinders their intention to purchase online. Thus, for a type of product like makeup, the inability to test the product or have the feasible product on sight will also affect how they feel about purchasing the product online. The survey showed that 58% respondents consider a sense of trust to be important in encouraging the use of digital shopping platforms, and 31% of respondents prioritize the presence of reliable and genuine reviews (Deloitte 2020).

Additionally, a survey done by PWC Indonesia showed that 54% of respondents were more willing to purchase products produced locally, with the reasons 79% of respondents want to support the local economy, 59% of respondents prefer the short delivery time, and 58% of respondents said that the purchasing process is faster and more convenient. Previous studies from 2016-2019 also discussed how the customer purchasing intention might be affected by other factors like price, branding, location, media influence, However, the previous studies limitation never expected to face the phenomenon of a pandemic, and the immense growth that the online shopping industry would have during the past years, where more women have more accessibility of makeup products from anywhere in the world, and are easily influenced by customer's reviews and purchases. Therefore, this study is focused on analyzing the effect of newly discussed factors such as review quality, review quantity, a customer's attitude towards customer purchase intention of makeup products.

1.4 Research Questions and Research Objectives

1.4.1 Research questions

1. What is the effect of review quality on the purchase intention of Indonesian women when purchasing local makeup products through online shopping platforms?
2. What is the effect of review quantity on the purchase intention of Indonesian women when purchasing local makeup products through online shopping platforms?
3. What is the effect of customer attitude on the purchase intention of local makeup products through online shopping platforms?

1.4.2 Research objectives

1. To identify which factor from review quantity, review quality, customer attitude towards local makeup products, significantly affect the customer purchasing intention when buying through online platforms of women in Jakarta and Bekasi.
2. To compare the behavioral purchasing trends of women living in Jakarta and Bekasi before and after Covid-19 Pandemic.
3. To investigate the effect of online shopping features like reviews towards purchase intention of the customer.

1.5 Benefits of Research

Academical:

This study is intended to discuss the impact of online shopping attributes towards the purchase intention of Indonesian women when buying local made makeup products. The author of this research paper also intends to offer an extension of previous studies which might add value to the variables being examined, and serve as reference for future research on the same topic.

Practical:

In consideration of the new accessibility that Indonesian women have on high quality makeup products online, the increasing number of demands for these products increased during the pandemic. Locally made products offered customers similar quality products as international brands at a more affordable price. However, as mentioned before, customers fear the inability to test a product before purchasing it will heavily affect their buying decision, the use of reviews allows the customer to have more genuine information on what the product offers, and if it is worth the purchase. The study's findings will offer a new perspective and opinion on the expectations of customers when purchasing local makeup products, and brand marketers are able to view on the key success factors that can be implemented into their strategies and sell their products more effectively.

2. CHAPTER – LITERATURE REVIEW

This chapter will discuss various previous researches and authors with similar studies that have influenced the understanding of what affects the customer purchasing behavior and what similar factors that can be applied into the Indonesian context.

The theories chosen for this study is the Theory of Planned Behavior (TPB) will inform in depth regarding the breakdown of how the customer purchasing intention is affected. Additionally, this chapter will further discuss the terminology used throughout the research and explain the research framework used for this research.

2.1 Theory of Planned Behavior

The Theory of Planned behavior is an extension of the Theory of Reasoned Action written by Ajzen 1991 (Lee, Jeon, et al, 2019). TPB suggest that the customer behavior is guided by three factors: Behavioral beliefs, about the likely consequences of behavior, the beliefs of the normative expectation of the public also named Normative beliefs, and the beliefs about the factors that will facilitate or impede the intent to behave on that particular action also known as Control beliefs (Bonsjak, Ajzen, Schmidt 2020).

The first factor the behavioral beliefs will be responsible for the attitude produced towards that certain behavior, normative beliefs are a result from a perceived social pressure or subjective norm, and control beliefs give as result the behavioral control or what holds a customer back from making a purchasing decision (Bonsjak, Ajzen, Schmidt 2020). Therefore, the more positive attitude and subjective norm and greater perceived control they have, the stronger the intent to purchase.

2.2 Theoretical Framework

The theoretical framework will illustrate the variables which will be considered throughout the research and which flow the relationship between Review quantity and purchase intention, Review quality and purchase intention, and lastly customer attitude and purchase intention.

Figure 2.1: Theoretical Framework

2.3 Hypothesis Development

2.3.1 Review quantity and Purchase Intention

Review quantity refers to the number of reviews given to the product or service by the customers (Sutanto and Aprianingsih, 2016), in previous studies it was proven that the review quantity given to the product will influence positively the purchasing decision of other customers. The bigger the number of reviews given to the product, the more likely the product will be purchased (Park et al, 2007). The bigger the number of reviews given, the higher the product popularity, thus it also creates a sense of trust for the customer as many others have already experienced purchasing the product. As previous results have shown significant effect that review quantity has on the customer's purchasing intention for premium cosmetics sold in Indonesia, this study will intent to study if the same effect of review quantity on customer purchasing intention when buying local makeup products, as these products are of similar product line, with different values will the number of reviews further influence the women in Indonesia to purchase online.

H1: Review quantity will have positive impact the customer's purchasing intention when buying local Indonesian makeup products online

2.3.2 Review Quality and Purchase Intention

Online review quality will influence the customer if the arguments being given on the review are of high-quality information and satisfactory to their needs and wants (Lkhaasuren and Nam, 2018). Throughout this study, the use of online review quality will be used as a factor that influences the customer's purchase intention of local makeup products, previous studies have proven that review quality has positive impact on the customers purchasing behavior, as it allows the customer to access helpful information and help them determine the quality of the product or service.

H2: Review quality will have positive impact the customer's purchasing intention when buying local Indonesian makeup products online

2.3.3 Customer Attitude and Purchase Intention

there are other factors to be considered that will possibly affect the customer's attitude towards local makeup products, for example, a customer's level of knowledge (Lee, Park and Han, 2008) about the product's content, product's price, or products reviews among other products that the customer compares in the online shopping platform. In consideration that the factors will be different for every customer in different situations (Kim and Chung, 2011)

H3: There is positive relationship between customer attitude and purchasing intention of locally produced makeup products

3. CHAPTER – METHODOLOGY

3.1 Type of Research

This research will be formed as quantitative research, which encompasses a variety of numerical methods and analysis using statistics with the purpose to aid researchers in understanding certain phenomena among populations (Watson R, 2015). Following its quantitative form, the study will be a descriptive research, which will confirm or describe specific characteristics of the variables in the study (Ethridge, D.E.,2004). The author will describe the relationship between the variables, more specifically the effect of the independent variables on the dependent variable.

3.2 Source Data

The type of data used in this study will further support the information discussed, and answer the research questions mentioned before. The type of data is divided into two categories, the primary and secondary data:

1. Primary data is collected directly from the respondents, with the use of questionnaires which will be constructed based on the variables and theoretical information to fit the target population.
2. Secondary data is accessed through previously written literatures, as references to support the extensive study done in this paper.

3.3 Data Collection Method

Data is collected through online questionnaires which are intended to be distributed to the respondents through the use of google form and social media. The questionnaires are intended to be created with systematic structure, which will allow the well formulation of the questions and address the discussed variables used in the study. The questionnaires will contain a series of questions and use the Likert scale of 1-5, 1 being the answers for "Strongly Disagree", 2 for the answers "Disagree", 3 for the answers "Neutral", 4 for the answers "Agree", and 5 being for the answers "Strongly Agree". The secondary data is taken from chosen literature and articles with similar topics and variables which have been made before by other authors, in order to support this paper's statements and findings.

3.4 Population and Sample

3.4.1 Population

The population for this research will be Indonesian women who are users of online shopping platforms and current users of local makeup products. The questionnaire intends to target the women in Jakarta and Bekasi who are currently have adopted the use of local brands, with the use of Google form that will spread the questionnaire to the wanted audience. The use of social media will also be used to share the questionnaire and reach bigger audiences.

3.4.2 Sample

The sampling methodology used in this paper will be non-probability sampling technique, specifically the purposive sampling which will allow the author to set up the criteria's required for the population wanted. The criteria are broken down into, 1) Indonesian Women, 2) Live in the city of Jakarta or Bekasi, 3) Users of local makeup products, 4) Individuals that like to shop Online, and lastly 5) Age range from 18 to 50+ years old. Purposive sampling is also known as the judgmental sampling which allows the author to select the population required based on specific judgements, in order to represent a part of the population (Anita S Acharya, Anupam Prakash, Pikee Saxena, Aruna Nigam, 2013). The following are the requirements for the sample for this study:

3.5 Measurement of Variables

Prior to the measurement of the variables, the researcher identified the variables of importance to the study and which are to be analyzed after data collection analysis. The variables used in this study are: Independent Variables: Review Quality, Review Quantity, and Customer Attitude, following the Dependent variable is: Purchasing Intention. With the use of previous research, the author intends to make use of mentioned variables and items to create an extension of the study and carefully structured questionnaires for the targeted population.

3.6 Development of Questionnaires

The structuring of the survey questionnaire is based on the theoretical background of previously discussed theories, the TPB by Ajzen 1991 (Clement Lee, Lam Jeen, NG Sut, Ooi Shi, Tai Yu, 2019). And the purchasing intention levels discussed by Sarah Peterson 2021.

The questionnaire is divided into 3 segments, Segment A, B, and C:

- The first segment of the questionnaire includes questions for screening for the right target audience. Which includes information about the respondents and whether they are fit to answer the following questions.
- The second segment will include questions regarding the customer's profile and purchasing behavior, where it is purchasing online or offline, with an answering system of multiple choice.
- The last segment includes questions regarding the effectiveness of each variable used in this research towards the customer's purchase intention, with an answer system of Likert scale of 5.

3.7 Reliability and Validity of Questionnaire

In this research the validity of the questions and each variable will be tested with the use of the Pearson correlation from the SPSS (Statistical Package for the Social Sciences) software, where the correlation is between +1.00 and -1.00 will show the positive or negative correlation. In Addition, the reliability will be tested using the Cronbach Alpha Coefficient, where the results require to be higher than 0,6 to reach a good quality result, in other words, the questions and variables are reliable.

4. CHAPTER – DATA ANALYSIS AND DISCUSSION

4.1 Respondents profile

Table 4.1 shows the results from the targeted respondents who are users of local makeup and use online shopping platforms to purchase the makeup products. The majority of responses for the questionnaire is shown to be Females (96.3%) between the ages of 18-29 (48.1%), currently located in the city of Jakarta (53.1%), with the occupation being self-employed or owning business (33.1%). These results indicate that there is potential for local makeup products selling online to target a group of customers based on the criteria's shown in table 4.1. The results also showed that respondents (98%) are users of online shopping platforms, and usually spend less than an hour shopping online (58.1%), with a spending range up to more than Rp 300.000 on local makeup products. In comparison with the purchasing time customers spend shopping offline, based on results the respondents showed they spend over 2 hours (34.4%) shopping offline. These results indicate that local makeup products are potentially rising among the middle to high class community.

The table above also showed that out of 156 respondents 89 (57%) prefer online shopping over offline shopping, with the 3 top chosen reasons being, number 1 more Price Bargaining, reason number 2 is Convenience, and reason number 3 being Reliable Customer Purchasing Data (Reviews, Ratings, Feedbacks). On the other hand, the number of respondents that prefer to shop offline was 67 (43%) respondents, with the three top chosen reasons being, number 1 Feasible product testing, reason number 2 being Low risk of low quality, and number 3 being a Habit (previous purchasing experience). The results indicate that there is a positive influence from the reviews given on a product, on the purchasing decision of the customer when buying local makeup online. This is because customers want to be sure of their purchase specially when using online shopping platforms, the reviews will allow the customer to find more information about the product and avoid risks of shopping online.

4.2 Validity and Reliability test

The use of Pearson correlation coefficient was used in this study in order to test the validity of the questions provided to the respondents. The convergent validity is shown in the table above highlighted by the black lined boxes, the Pearson R value was shown to be between .3 and .5 indicating that approximately close to 1, meaning the correlation coefficient is positive at a significance level of less than 0.05 and N samples of 156. The author's use of question/instruments for each variable and item is proven to be Valid.

On the other hand, discriminant validity, are the values surrounding the highlighted boxes, which are shown to be of weak and moderate correlation as Pearson Coefficient R is above 0 and none to be of negative correlation. This also indicates validity among the other variables.

4.2.2 Reliability Test Result (Cronbach Alpha Coefficient)

The author used the Cronbach Alpha Coefficient in order to test the reliability of the instrument questions and items used for this study. Based on the table 4.3, the results show that every variable instrument is reliable as the Alpha coefficient is greater than 0.6, listed as Review Quality (.785), Review Quantity (.725), Customer Attitude (.767), and Purchasing intention (.688). The overall results of the reliability test also indicate greater reliability with a value of .916.

4.6 Independency Test

4.6.1 Mann Whitney U test

Table 4.6 Ranks

	Preferred Method of Shopping	N	Mean Rank	Sum of Ranks
Purchase Intention	Online	89	83.2	7405
	Offline	67	72.25	4841
	Total	156		

The man Whitney test was used as a non-parametric test alternative to the independent sample t test. In order to understand where the two samples are most likely to derive from the same population, and defining whether both are equal or no. As shown in table 4.6 the grouping variable used is the samples from preferred shopping method, Online (N=89) and Offline (N=67). Based on the mean rank, the mean was highest from the samples of preferred shopping method Online. The Null hypothesis for the Mann-Whitney U test in this case would be:

H_0 : The two populations are equal

H_1 : The two populations are not equal

Table 4.7 Mann-Whitney U Test. Results

<i>Test Statistics^a</i>	
	Purchase Intention
Mann-Whitney U	2563
Wilcoxon W	4841
Z	-1.678

Asymp. Sig. (2-tailed)	0.093
------------------------	-------

a Grouping Variable

The following table defines the significance of difference between the two samples mentioned before. The Asymp. Sig is at 0.093 which is higher than the alpha of 0.05, which would indicate for the null hypothesis to be rejected as the populations are not equal. However, with the use of the Kruskal Wallis test and the Effect Size formula the null hypothesis can be retained. With the use of the Z value shown in table 5.7, the Effect size formula can be formed.

$$\text{Effect size: } r = \frac{Z}{\sqrt{N}}$$

$$r = \frac{1.678}{\sqrt{156}}$$

$$r = \frac{1.678}{12.489}$$

$$r = 0.13$$

Effect Size r is valued at 0.13 indicating that the difference is less than 0.3 which represents a small effect on the difference between the two populations of preferred methods of shopping.

4.6.2 Kruskal Wallis Test

Furthermore, Kruskal Wallis test which is a non-parametric testing method where it requires data to be ordinal or continuous. The Kruskal Wallis test is the equivalent to the parametric test ANOVA, and does not consider the normal distribution of the data.

Table 4.8 Kruskal Wallis Test Results

Hypothesis Test Summary				
	Null Hypothesis	Test	Sig.	Decision
1	The distribution of PI4 is the same across categories of Preferred Method of Shopping.	Independent-Samples Mann-Whitney U Test	0.298	Retain the null hypothesis.
2	The distribution of PI4 is the same across categories of Preferred Method of Shopping.	Independent-Samples Kruskal-Wallis Test	0.298	Retain the null hypothesis.
Asymptotic significances are displayed. The significance level is .050. 1 = Online Shopping 2 = Offline Shopping P14 = Purchasing intention				

Table 4.9 Independent – Samples Kruskal-Wallis Test

Independent-Samples Kruskal-Wallis Test Summary

Total N	156
Test Statistic	1.085 ^{a,b}
Degree Of Freedom	1
Asymptotic Sig.(2-sided test)	0.298
<p>a The test statistic is adjusted for ties. b Multiple comparisons are not performed because the overall test does not show significant differences across samples.</p>	

The null hypothesis is retained as the Kruskal Wallis test shows in table 4.8, where at the p-value of 0.298 the hypothesis is accepted because the p-value is < than 0.05. These results also indicate the two populations being examined are equal.

The Spearman Rank test is a non-parametric test used on ordinal data or scale data. The test is the alternative of the Linear regression test, and it analyses the relationship between every variable. The graph above is able to show the relationship between each variable, mainly focusing on the relationship of the Independent variables (Review Quality, Review Quantity, Customer Attitude) with the Dependent Variable (Purchasing Intention).

As the Spearman Rank assumes that variables have a Monotonic relationship that being either, if one of the variables increases, the other variable will also increase, or, if one of the variables increases, the other one decreases. Based on the graph shown in figure 4.2, the relationship between Review Quality and Purchasing Intention seems to be increasing at the same pace, and it's almost linear diagonally to the top of the graph, similarly the other graphs also follow a similar pattern, which shows positive correlation.

Table 4.10 Spearman Correlation rho

Correlations						
			Rqual	Rquan	CA	PI
Spearman's rho	Review Quality	Correlation Coefficient	1	.725**	.692**	.612**
		Sig. (1-tailed)	.	0	0	0
		N	156	156	156	156
	Review Quantity	Correlation Coefficient	.725**	1	.642**	.630**
		Sig. (1-tailed)	0	.	0	0
		N	156	156	156	156
	Customer Attitude	Correlation Coefficient	.692**	.642**	1	.692**
		Sig. (1-tailed)	0	0	.	0
		N	156	156	156	156
	Purchasing Intention	Correlation Coefficient	.612**	.630**	.692**	1
		Sig. (1-tailed)	0	0	0	.
		N	156	156	156	156

** Correlation is significant at the 0.01 level (1-tailed).

Rqual : Review Quality
Rquan : Review Quantity
CA: Customer Attitude
PI : Purchasing Intention

The table 4.10 is the results from the spearman correlation, which shows the correlations coefficient of the independent and dependent variables. The output shows that the spearman's rank order correlation is significant at $\rho N= 156 = .692$ being the highest correlation number $P < 0,05$. Indicating that the higher the customer attitude the higher the purchasing intent of the customer to buy local makeup products online.

H1: Review quantity will have positive impact the customer's purchasing intention when buying local Indonesian makeup products online

H2: Review quality will have positive impact the customer's purchasing intention when buying local Indonesian makeup products online

H3: There is positive relationship between customer attitude and purchasing intention of locally produced makeup products

After hypothesis testing, it was found that the highest correlation is shown by the H3, there is a positive relationship between customer attitude and purchasing intention of locally produced makeup products at a value of Spearman ρ : .692. And the lowest spearman correlation was shown by the hypothesis H2 Review quality will have a positive impact on the customer's purchasing intention when buying local Indonesian makeup products online at a value of Spearman ρ : .612.

CONCLUSION AND RECOMMENDATION

It was revealed in the results of this research that the hypothesis has been confirmed, the three independent variables have positive and significant relationship towards the dependent variables. Indicating that factors like Review Quality, Review Quantity and Customer Attitude have positive influence on the Purchasing Intention of females living in the cities of Jakarta and Bekasi. Results on the factor Customer Attitude towards locally produced makeup products were specifically higher in terms of influence towards the customer purchasing intention, implying the results support this research's objectives and previous studies hypothesis.

On the other hand the results for the factors Review Quality and Review Quantity, while Spearman Rank correlation with purchasing intention was significant, the Review quality did not exceed as higher as Review Quantity. Indicating that the female customers when purchasing makeup products online are more concerned with the number of reviews given to the product on the online shopping platform, rather than other people's review quality on the product. Furthermore this results support this research's objectives.

Recommendations

Future studies could extend the results of this study into reaching for bigger samples, as it is one of the limitations given on this research paper. Secondly the study could also emphasize

6th International CEO Communication, Economics, Organization & Social Sciences Congress

on the age variety given that in this research the age range of 18-29 was significantly higher in terms of activity in online shopping platforms and purchasing local makeup products, meaning it could identify other reasons why the customer behaviour change affected more towards certain generations compared to other generations. This study could also take an extension towards understanding why the surge of local makeup products happened only recently, how are these brands competing against the international brands that are located in the Indonesian beauty Market.
